TITLE JOURNAL

COMMENT

* NOTE: This record contains 88 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.

Contact: nisc_zoo@nhgri.nih.gov
----- Project Information
Center project name: djz
Center clone name: 427020

The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicated order and orientation of each sequence contig has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8X average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associated with a Phrap-derived quality score.

----- Summary Statistics
Sequencing vector: plasmid; n/a; 100% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.990319
Consensus quality: 152954 bases at least Q40
Consensus quality: 153013 bases at least Q30
Consensus quality: 153042 bases at least Q20
Insert size: 140000; agarose-fp
Insert size: 153064; sum-of-contigs
Quality coverage: 11.86x in Q20 bases; agarose-fp
Quality coverage: 10.84x in Q20 bases; sum-of-contigs

* NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have been provided by the submitter.
* This sequence will be replaced
* by the finished sequence as soon as it is available and the accession number will be preserved.
* 1 69854: contig of 69854 bp in length
* 69855 69954: gap of unknown length
* 69955 108944: contig of 38990 bp in length
* 108945 109044: gap of unknown length
* 109045 153264: contig of 44220 bp in length.

NOTICE:

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phased quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see <http://genome.wustl.edu>

SOURCE INFORMATION:

The RP11-11 human BAC library was made from the blood of one male donor, as described by Osoegawa,K., Woon,P.Y., Zhao,B., Frengen,E., Tateno,M., Catanesi,J.J. and de Jong,P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (<http://www.resgen.com>) or Pieter de Jong and coworkers at <http://www.chori.org>
VECTOR: pRACe3.6

NEIGHBORING SEQUENCE INFORMATION:

The clone sequenced to the left is RP11-98F19; the clone sequenced to the right is RP11-395A23. Actual start of this clone is at base position 1 of RP11-69J7; actual end is at base position 174699 of RP11-69J7.

2 (bases 1 to 183066)
Worley,K.C.
Direct Submission
Submitted (29-MAY-2002) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
3 (bases 1 to 183066)
Rat Genome Sequencing Consortium.
Direct Submission
Submitted (15-NOV-2002) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
On Nov 15, 2002 this sequence version replaced gi:23815384.
The sequence in this assembly is a combination of BAC based reads
and whole genome shotgun sequencing reads assembled using Atlas
(http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
in the feature table below represents a scaffold in the Atlas
assembly (a 'contig-scaffold'). Within each contig-scaffold,
individual sequence contigs are ordered and oriented, and separated
by sized gaps filled with Ns to the estimated size. The sequence
may extend beyond the ends of the clone and there may be sequence
contigs within a contig-scaffold that consist entirely of whole
genome shotgun sequence reads. Both end sequences and whole genome
shotgun sequence only contigs will be indicated in the feature
table.

----- Genome Center
Center: Baylor College of Medicine
Center code: BCM
Web site: http://www.hgsc.bcm.tmc.edu/
```

Contact: hgsc-help@bcm.tmc.edu
 ----- Project Information
 Center project name: GTDP
 Center clone name: CH230-391M15
 ----- Summary Statistics
 Assembly program: Phrap; version 0.990329
 Consensus quality: 157421 bases at least Q40
 Consensus quality: 161044 bases at least Q30
 Consensus quality: 163069 bases at least Q20
 Estimated insert size: 157850; sum-of-contigs estimation
 Quality coverage: 5x in Q20 bases; sum-of-contigs estimation

 * NOTE: Estimated insert size may differ from sequence length
 * (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
 * NOTE: This is a 'working draft' sequence. It currently
 * consists of 2 contigs. The true order of the pieces
 * is not known and their order in this sequence record is
 * arbitrary. Gaps between the contigs are represented as
 * runs of N, but the exact sizes of the gaps are unknown.
 * This record will be updated with the finished sequence
 * as soon as it is available and the accession number will
 * be preserved.
 * 1 181686: contig of 181686 bp in length
 * 181687 181786: gap of unknown length
 * 181787 183066: contig of 1280 bp in length.

----- Project Information
Center project name: MCOB
Center clone name: RP23-231M6
----- Summary Statistics
Sequencing vector: Plasmid
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.990329
Consensus quality: 224150 bases at least Q40
Consensus quality: 225905 bases at least Q30
Consensus quality: 227145 bases at least Q20
Estimated insert size: 225835; sum-of-contigs estimation
Quality coverage: 9x in Q20 bases; sum-of-contigs estimation

* NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html).
* NOTE: This is a 'working draft' sequence. It currently consists of 12 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

COMMENT

Submitted (01-JUN-2005) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
 On Jun 29, 2005 this sequence version replaced gi:66792995.
 The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome

shotgun sequence only contigs will be indicated in the feature table.

Center: Genome Center
 Center code: BCM
 Web site: <http://www.hgsc.bcm.tmc.edu/>
 Contact: hgsc-help@bcm.tmc.edu
 Project Information
 Center project name: FHIZ
 Center clone name: CH240-121K5
 Assembly program: Atlas 3.0;
 Consensus quality: 170996 bases at least Q40
 Consensus quality: 192270 bases at least Q30
 Consensus quality: 201398 bases at least Q20
 Estimated insert size: 240476; sum-of-contigs estimation
 Estimated insert size: 103626; agarose-fp estimation
 Quality coverage: 7x in Q20 bases; agarose-fp estimation
 Quality coverage: 3x in Q20 bases; sum-of-contigs estimation
 NOTE: Estimated insert size may differ from sequence length
 (see http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html).
 NOTE: This is a 'working draft' sequence. It currently consists of 55 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

3 (bases 1 to 221701)

Rat Genome Sequencing Consortium

Submitted (20-NOV-2002)

Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Nov 20, 2002 this sequence version replaced gi:22953874.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

COMMENT

The sequence in this assembly is a combination of BAC based reads
 and whole genome shotgun sequencing reads assembled using Atlas
 (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). As a result, the
 sequence may extend beyond the ends of the clone and there may be
 contigs that consist entirely of whole genome shotgun sequence
 reads. Both end sequences and whole genome shotgun sequence only
 contigs will be indicated in the feature table.

COMMENT

The sequence in this assembly is a combination of BAC based reads
and whole genome shotgun sequencing reads assembled using Atlas
(http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
in the feature table below represents a scaffold in the Atlas
assembly (a 'contig-scaffold'). Within each contig-scaffold,
individual sequence contigs are ordered and oriented, and separated
by sized gaps filled with Ns to the estimated size. The sequence
may extend beyond the ends of the clone and there may be sequence
contigs within a contig-scaffold that consist entirely of whole
genome shotgun sequence reads. Both end sequences and whole genome
shotgun sequence only contigs will be indicated in the feature
table.

Contact: hgsc-help@bcm.tmc.edu
----- Project Information
Center project name: GABK
Center clone name: CH230-2M18
----- Summary Statistics
Assembly program: Atlas;
Consensus quality: 235495 bases at least Q40
Consensus quality: 236589 bases at least Q30

Consensus quality: 237381 bases at least Q20
 Estimated insert size: 244427; sum-of-contigs estimation
 Quality coverage: 8x in Q20 bases; sum-of-contigs estimation

 * NOTE: Estimated insert size may differ from sequence length
 (see http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html).
 * NOTE: This is a 'working draft' sequence. It currently
 consists of 1 contigs. Gaps between the contigs
 are represented as runs of N. The order of the pieces
 is believed to be correct as given, however the sizes
 of the gaps between them are based on estimates that have
 been provided by the submitter.
 * This sequence will be replaced
 * by the finished sequence as soon as it is available and
 * the accession number will be preserved.
 * The accession number will be 252441 bp in length.

3 (bases 1 to 263882)

Rat Genome Sequencing Consortium.

Direct Submission

Submitted (13-MAY-2003) Human Genome Sequencing Center, Department

of Molecular and Human Genetics, Baylor College of Medicine, One

Baylor Plaza, Houston, TX 77030, USA

On May 13, 2003 this sequence version replaced gi:24942501.

The sequence in this assembly is a combination of BAC based reads

and whole genome shotgun sequencing reads assembled using Atlas

(<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described

in the feature table below represents a scaffold in the Atlas

assembly (a 'contig-scaffold'). Within each contig-scaffold,

individual sequence contigs are ordered and oriented, and separated

by sized gaps filled with Ns to the estimated size. The sequence

may extend beyond the ends of the clone and there may be sequence

contigs within a contig-scaffold that consist entirely of whole

genome shotgun sequence reads. Both end sequences and whole genome

shotgun sequence only contigs will be indicated in the feature

table.

TITLE        Direct Submission
JOURNAL      Submitted (28-MAR-2003) Berkeley Drosophila Genome Project,
              Lawrence Berkeley National Laboratory, One Cyclotron Road,
              Berkeley, CA 94720, USA
COMMENT      Sequence submitted by:
              Berkeley Drosophila Genome Project
              Lawrence Berkeley National Laboratory
              Berkeley, CA 94720
              This clone was sequenced as part of a high-throughput process to
              sequence clones from Drosophila Gene Collection 1 (Rubin et al.,
              Science 2000). The sequence has been subjected to integrity checks
              for sequence accuracy, presence of a polyA tail and contiguity
              within 100 kb in the genome. Thus we believe the sequence to
              reflect accurately this particular cDNA clone. However, there are
              artifacts associated with the generation of cDNA clones that may
              have not been detected in our initial analyses such as internal
              priming, priming from contaminating genomic DNA, retained introns
              due to reverse transcription of unspliced precursor RNAs, and
              reverse transcriptase errors that result in single base changes.
              For further information about this sequence, including its location
              and relationship to other sequences, please visit our Web site
              cdna@fruitfly.berkeley.edu.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

XX A method, useful for prognosing and treating solid tumor, comprises
XX comparing an expression profile of a gene expressed in peripheral blood
XX mononuclear cells to a reference expression profile of a gene.
XX Disclosure; Page; 111pp; English.

```

XX The invention describes a method comprising comparing an expression
 CC profile of at least one gene in a peripheral blood sample of a patient to
 CC at least one reference expression profile of the at least one gene, where
 CC the patient has a solid tumour, and each of the gene is differentially
 CC expressed in peripheral blood mononuclear cells (PBMCs) of a first class
 CC of patients as compared to PBMCs of a second class of patients, where
 CC both the first and second classes of patients have the solid tumour, and
 CC each of the first and second classes is a subcluster formed by an
 CC unsupervised clustering analysis of gene expression profiles in PBMCs of
 CC a population of patients who have the solid tumour, and where the
 CC majority of the first class of patients has a first clinical outcome, and
 CC the majority of the second class of patients has a second clinical
 CC outcome. Also described are: a system comprising (i) a memory or a
 CC storage medium including data that represent an expression profile of at
 CC least one gene in a peripheral blood sample of a patient who has a solid
 CC tumour, (ii) at least another storage medium including data that
 CC represent at least one reference expression profile of the gene, (iii) a
 CC program capable of comparing the expression profile to the reference
 CC expression profile, and (iv) a processor capable of executing the
 CC program, where expression levels of the gene in peripheral blood
 CC mononuclear cells of patients who have the solid tumour correlate with
 CC clinical outcomes of the patients; and a nucleic acid or protein array
 CC comprising concentrated probes for solid tumour prognosis genes, where
 CC each of the solid tumour prognosis genes is differentially expressed in
 CC PBMCs of a first class of patients as compared to PBMCs of a second class
 CC of patients, where both the first and second classes of patients have a
 CC solid tumour, and where the first class of patients has a first clinical
 CC outcome, and the second class of patients has a second clinical outcome.
 CC The method, system, and array are useful for prognosing and treating
 CC solid tumours. This sequence represents a solid tumour prognosis gene of
 CC the invention. Note: The sequence data for this patent did not form part
 CC of the printed specification, but was obtained in electronic format
 CC directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
 response useful in vaccinating against and in treating tumors.

XX Disclosure; Page 78-79; 79pp; English.

XX The present sequence encodes the canine 5T4 tumour-associated antigen (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were inoculated with a virus expression vector containing the human or murine 5T4 gene sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a subject

XX Detecting a breast cancer-associated transcript in a patient's cell, useful for diagnosing breast cancer, comprises contacting a biological sample with a polynucleotide that selectively hybridizes with breast cancer nucleic acids.

XX Claim 9; Page 372; 414pp; English.

XX The invention comprises a method of detecting a breast cancer-associated transcript in a cell from a patient. The method of the invention involves contacting a biological sample from the patient with a nucleotide that hybridises to one of the 69 breast cancer-associated gene sequences shown in the specification. The method of the invention is useful in the diagnosis or prognosis of breast cancer, and for detecting genes that are up or down-regulated in breast cancer cells. Genes identified by the method of the invention can be used in diagnostic purposes and also as targets for screening for therapeutic compounds that modulate breast cancer (e.g. hormones or antibodies). Identification of genes that are over or under expressed in breast cancer can additionally provide high-resolution, high-sensitivity datasets which can be used in the areas of diagnostics, therapeutics, drug development, pharmacogenetics, protein structure and biosensor development. DNA sequences ABT07693 - ABT07761 represent the 69 breast cancer-associated gene sequences of the invention

XX Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the

PT patient with a polynucleotide that exhibits increased or decreased
PT expression in lung cancer.
XX
XX
PS Claim 22; Page 336; 453pp; English.
XX
CC The invention relates to a method for detecting a lung cancer-associated
CC transcript in a cell from a patient, comprising contacting a biological
CC sample from the patient with a polynucleotide that selectively hybridizes
CC to a sequence that is at least 80 % identical to a gene that exhibits
CC increased or decreased expression in lung cancer samples. Lung cancer-
CC associated polynucleotides and polypeptides are used for identifying a
CC compound that modulates a lung cancer-associated polypeptide, for
CC inhibiting proliferation of a lung cancer-associated cell to treat lung
CC cancer in a patient and for treating a mammal having lung cancer by
CC administering a modulatory compound identified. The methods are useful
CC for treating lung cancer, such as small cell lung cancer, non-small cell
CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
CC for diagnostic purposes and as targets for screening for therapeutic
CC compounds that modulate lung cancer, such as antibodies. Sequences
CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
CC invention

PT Detecting an ovarian cancer-associated transcript in a cell from a
PT patient, comprises contacting a biological sample from the patient with a
PT polynucleotide that hybridizes to an ovarian cancer gene.
XX
XX
PS Claim 10; Page 297; 332pp; English.
XX
XX The invention relates to a method of detecting an ovarian cancer-
CC associated transcript in a cell from a patient, by contacting a
CC biological sample from the patient with a polynucleotide that selectively
CC hybridizes to a sequence at least 80% identical to any of one of 80
CC nucleic acid sequences given in the specification. The method is useful
CC in diagnosing ovarian cancer and in identifying and using agents and/or
CC targets that inhibit ovarian cancer. The nucleic acid molecule,
CC polypeptide and the antibody may also be used in detecting ovarian
CC cancers, monitoring and early detection of relapse following treatment,
CC monitoring response to therapy, selecting patients for post-operative
CC chemotherapy or radiation therapy, in selecting mode of therapy,
CC determining tumour prognosis, early detection of pre-cancerous lesions,
CC and as vaccines. This sequence corresponds to one of the nucleic acids
CC used for the detection method of the invention.

 PT Determining the presence or absence of a pathological cell in a patient,
 PT useful for diagnosing, prognosing or treating cancer, comprises detecting
 PT a nucleic acid in a biological sample.
 XX
 CC Claim 8; SEQ ID NO 41; 1385pp; English.
 XX
 CC The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
 CC whose expression is upregulated or downregulated in specific cancers or
 CC other diseases such as angiogenic or fibrotic disorders, and to methods
 CC of determining the presence or absence of a pathological cell in a
 CC patient by detecting a nucleic acid at least 80% identical to those of
 CC the invention or by detecting a polypeptide of the invention. The
 CC invention also relates to expression vectors and host cells comprising a
 CC nucleic acid of the invention; antibodies which specifically bind a
 CC polypeptide of the invention; use of such antibodies for drug targeting;
 CC and methods of screening for modulators of activity or expression of the
 CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
 CC antibodies and methods are useful for diagnosing, prognosing and treating
 CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
 CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
 CC neovascularisation syndromes, scarring and uterine fibroids. They may
 CC also be useful in wound healing and in contraception. The present
 CC sequence represents a nucleic acid sequence of the invention.

 XX Identifying a candidate p53 pathway-modulating agent for treating cancer
 PT comprises contacting an assay system comprising a purified leucine rich
 PT repeat, capricious related polypeptide or nucleic acid with a test agent.
 XX
 PS Example 5; Page 74-75; 99pp; English.
 XX
 CC The invention relates to a method of identifying a candidate p53 pathway
 CC modulating agent. The method involves contacting an assay system
 CC comprising a purified leucine rich repeat, capricious related (LRRCAPS)
 CC polypeptide or nucleic acid or its fragment with a test agent and
 CC detecting a test agent-biased activity, where a difference between the
 CC test agent-biased activity and the reference activity identifies the test
 CC agent as a candidate p53 pathway modulating agent. The method is useful
 CC for identifying a candidate p53 pathway-modulating agent for preparing a
 CC composition for diagnosing or treating cancer. The invention is useful in
 CC gene therapy. The present sequence is human LRRCAPS related DNA

XX Claim 16; Page 114-115; 619pp; English.

XX The present invention relates to new isolated proteins (NOVX) and their
CC coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is
CC any number from 1 to 48. The NOVX proteins and coding sequences are
CC useful in the manufacture of a medicament for treating a syndrome
CC associated with a human disease, preferably a NOVX-associated disorder.
CC The NOVX coding sequences and proteins are useful for treating,
CC preventing or diagnosing diseases such as metabolic disorders, diabetes,
CC obesity, infectious disease, anorexia, cancer-associated cachexia,
CC cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's
CC disease, immune disorders, haematopoietic disorders, cardiovascular
CC disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic
CC disturbances associated with obesity, metabolic syndrome X or wasting
CC disorders associated with chronic diseases or various cancers. The NOVX
CC coding sequences and proteins may also be used as targets for the
CC identification of small molecules that modulate or inhibit e.g.
CC neurogenesis, cell differentiation, cell proliferation, haematopoiesis,
CC wound healing and angiogenesis, in gene therapy, in generation of
CC antibodies that bind immunospecifically to NOVX substances for use in
CC therapeutic or diagnostic methods

XX Novel canine or feline 5T4 polypeptide and polynucleotides encoding the
PT polypeptide, useful in preparation of vaccine for treating and/or
PT preventing cancer in a subject, preferably a dog or cat.
XX Claim 4; Page 68; 60pp; English.
PS The present invention relates to the isolation of canine and feline
CC oncofetal leucine-rich glycoproteins known as 5T4, and the
CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in
CC a significant proportion of tumours. The sequences of the invention are
CC useful in a pharmaceutical composition for the prevention and/or
CC treatment of tumours or other diseases associated with cell
CC proliferation, infections, and inflammatory conditions in animals,
CC preferably dogs or cats. The compositions may also be used for cancer
CC immunotherapy in these animals. The sequences of the invention may also
CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
CC measurement and localisation of 5T4 in extracts of plasma, urine,
CC tissues, and in cell culture media. Antibodies specific for the 5T4
CC protein are useful for isolating foetal cells from maternal blood. The
CC isolation process may form part of a diagnostic method e.g. the foetal
CC cells may then be subject to biochemical or genetic sampling used for
CC testing foetal abnormalities, or to determine the sex of the foetus(es).
XX The present sequence encodes feline 5T4 protein

XX New major histocompatibility complex class I peptide epitopes from human
PT 5T4 tumor-associated antigen, useful for preventing and/or treating a
PT disease, particularly cancer.
XX Disclosure; Page 67; 73pp; English.
XX The invention relates to a novel Major Histocompatibility Complex (MHC)
CC class I peptide epitope of the 5T4 antigen. The invention further
CC provides a polypeptide string comprising the 5T4 epitope; a nucleic acid
CC sequence encoding the 5T4 epitope or a polypeptide string of the 5T4
CC epitope; a vector system capable of delivering the 5T4 epitope nucleic
CC acid to a cell; a cell pulsed with the 5T4 epitope; a polypeptide of the
CC 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine
CC comprising the above; a method for treating and/or preventing a disease
CC in a subject by administering the vaccine; an agent capable of binding
CC specifically to the 5T4 epitope and/its encoding nucleic acid; a method
CC comprising detecting the presence of the 5T4 epitope or its encoding
CC nucleic acid in a subject; and a T cell line or clone capable of
CC specifically recognising the 5T4 epitope in conjunction with an MHC class
CC I molecule. The 5T4 epitope has cytostatic activity. The vaccine
CC comprising the 5T4 epitope or its encoding nucleic acid and the vector
CC system or cell is useful in the prevention and/or treatment of a disease,
CC particularly cancer. The detection method is useful for diagnosing or
CC monitoring the progression of a cancerous disease, and for detecting the
CC presence of the 5T4 epitope or its nucleic acid. The T cell line or clone
CC is useful in the manufacture of a medicament for treating and/or
CC preventing a disease. This polynucleotide sequence represents the feline
CC 5T4 antigen coding DNA of the invention.

XX PT Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
XX PT response useful in vaccinating against and in treating tumors.
XX PS Example 2; Page 78; 79pp; English.
XX CC The present sequence encodes the human 5T4 tumour-associated antigen
XX CC (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
XX CC carcinomas but has a highly restricted expression pattern in normal adult
XX CC tissues. It appears to be strongly correlated to metastasis in colorectal
XX CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
XX CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
XX CC induced were inoculated with a virus expression vector containing the
XX CC present sequence. The 5T4 antigen was shown to be effective at eliciting
XX CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
XX CC the antigen and the antigen itself can be used to elicit an immune
XX CC response, preferably CTL or an antibody response in a subject

 XX XX Use of single chain antibody capable of recognizing a disease associated
 XX FT molecule for manufacturing a medicament for preventing and/or treating a
 XX FT disease condition associated with disease associated molecule.
 XX XX Disclosure; Fig 26; 118pp; English.
 XX CC The specification describes the use of a single chain antibody (ScFv),
 XX CC which is capable of recognizing a disease associated molecule in the
 XX CC manufacture of a medicament for the prevention and treatment of a disease
 XX CC condition. The ScFv antibody is useful in the manufacture of a
 XX CC medicament, for affecting a disease in vivo, for preparing a
 XX CC pharmaceutical composition, for in vivo imaging and/or for adjuvant
 XX CC treatment of a disease. The ScFv antibody is also useful for treating
 XX CC inflammatory diseases including arthritis, hypersensitivity, autoimmune
 XX CC diseases, cancers, central nervous system disorders including Parkinson's
 XX CC disease, pericardial diseases, cardiopulmonary diseases, cardiovascular
 XX CC diseases, gastrointestinal disorders, infections, diabetes, Helicobacter-
 XX CC related diseases, and other immune disorders. The present sequence
 XX CC encodes a 5T4 protein, which is used to produce ScFv of the invention

 XX XX Novel canine or feline 5T4 polypeptide and polynucleotides encoding the
 XX FT polypeptide, useful in preparation of vaccine for treating and/or
 XX FT preventing cancer in a subject, preferably a dog or cat.
 XX XX Claim 1; Page 67; 68pp; English.
 XX CC The present invention relates to the isolation of canine and feline
 XX CC oncofoetal leucine-rich glycoproteins known as 5T4, and the
 XX CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in
 XX CC a significant proportion of tumours. The sequences of the invention are
 XX CC useful in a pharmaceutical composition for the prevention and/or
 XX CC treatment of tumours or other diseases associated with cell
 XX CC proliferation, infections, and inflammatory conditions in animals,
 XX CC preferably dogs or cats. The compositions may also be used for cancer
 XX CC immunotherapy in these animals. The sequences of the invention may also
 XX CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
 XX CC measurement and localisation of 5T4 in extracts of plasma, urine,
 XX CC tissues, and in cell culture media. Antibodies specific for the 5T4
 XX CC protein are useful for isolating foetal cells from maternal blood. The
 XX CC isolation process may form part of a diagnostic method e.g. the foetal
 XX CC cells may then be subject to biochemical or genetic sampling used for
 XX CC testing foetal abnormalities, or to determine the sex of the foetus(es).
 XX CC The present sequence encodes canine 5T4 protein

 PT Detecting a lung cancer-associated transcript in a cell from a patient
 PT for treating lung cancer, by contacting a biological sample from the
 PT patient with a polynucleotide that exhibits increased or decreased
 PT expression in lung cancer.
 XX
 PS Claim 22; Page 335; 453pp; English.
 XX
 CC The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridizes
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

 XX
 CC The invention relates to a method of identifying a candidate p53 pathway
 CC modulating agent. The method involves contacting an assay system
 CC comprising a purified leucine rich repeat, capricious related (LRRCAPS)
 CC polypeptide or nucleic acid or its fragment with a test agent and
 CC detecting a test agent-biased activity, where a difference between the
 CC test agent-biased activity and the reference activity identifies the test
 CC agent as a candidate p53 pathway modulating agent. The method is useful
 CC for identifying a candidate p53 pathway-modulating agent for preparing a
 CC composition for diagnosing or treating cancer. The invention is useful in
 CC gene therapy. The present sequence is human LRRCAPS DNA

 XX
 CC The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
 CC whose expression is upregulated or downregulated in specific cancers or
 CC other diseases such as angiogenic or fibrotic disorders, and to methods
 CC of determining the presence or absence of a pathological cell in a
 CC patient by detecting a nucleic acid at least 80% identical to those of
 CC the invention or by detecting a polypeptide of the invention. The
 CC invention also relates to expression vectors and host cells comprising a
 CC nucleic acid of the invention; antibodies which specifically bind a
 CC polypeptide of the invention; use of such antibodies for drug targeting;
 CC and methods of screening for modulators of activity or expression of the
 CC polypeptides and nucleic acids. The nucleic acids, polypeptides, and
 CC antibodies and methods are useful for diagnosing, prognosing and treating
 CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
 CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
 CC neovascularisation syndromes, scarring and uterine fibroids. They may
 CC also be useful in wound healing and in contraception. The present
 CC sequence represents a nucleic acid sequence of the invention.

 XX New antibody that binds to a tumor-associated antigenic target (TAT)
 PT polypeptide, useful for preparing a composition for diagnosing or
 PT treating cancer.
 XX Claim 1; SEQ ID NO 53; 319pp; English.
 PS The present invention relates to the isolation of human tumour-associated
 CC antigenic target (TAT) polynucleotide and polypeptide sequences. Also
 CC disclosed is an antibody that binds to a TAT polypeptide. The antibody is
 CC a monoclonal antibody, an antibody fragment, a chimeric antibody or a
 CC humanised antibody. It is conjugated to a growth inhibitory agent. It is
 CC produced in bacteria or in CHO cells and induces death of a cell to which
 CC it binds. The antibody is useful for preparing a composition for
 CC diagnosing or treating tumours and cancer. The present sequence
 CC represents a human TAT cDNA sequence of the invention.

CC The invention relates to human tumour-associated antigenic target (TAT)
CC polypeptides, and their related nucleic acids. The TAT polypeptides are
CC overexpressed in cancer tissues compared to normal tissues, and may thus
CC serve as effective targets for the diagnosis and treatment of cancer in
CC mammals. The invention also relates to nucleic acid and polypeptide
CC sequences at least 80% identical to the TAT nucleic acids and
CC polypeptides; expression vectors and host cells comprising a TAT nucleic
CC acid; an antibody specific for a TAT polypeptide; a peptide or organic
CC molecule which binds to a TAT polypeptide; fusion proteins comprising a
CC TAT polypeptide; and methods and compositions for the treatment or
CC diagnosis of cancer in mammals. TAT polypeptides, nucleic acids,
CC antibodies, antagonists, binding molecules and compositions are useful
CC for diagnosing or treating a cell proliferative disorder associated with
CC increased TAT expression, particularly cancers such as breast cancer,
CC colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder
CC cancer, pancreatic cancer, cervical cancer, cancers of the central
CC nervous system, melanoma and leukaemia. TAT nucleic acids may further be
CC used as hybridisation probes, in chromosome and gene mapping, in
CC chromosome identification and in gene therapy. The present sequence
XX represents a TAT nucleic acid of the invention

XX Identifying a compound that can treat disease or disorders, such as, a
 PT neuropsychiatric disorder e.g., schizophrenia, or autism, comprises
 PT determining the expression of one or more efficacy genes in a cell
 PT contacted with the test compound.
 XX
 PS Example 6; SEQ ID NO 174; 39pp; English.
 PS
 XX This invention relates to a novel screening method identified as a multi-
 CC parameter high throughput screening (MPHTS) assay. Specifically, it
 CC refers to an assay that utilises the disease signature of a plurality of
 CC specific genes associated with a particular disease, and identifies
 CC differential expression between those cells taken from individuals
 CC affected by that disease and those that are not affected. The present
 CC invention then describes the screening of candidate pharmaceutical
 CC compounds to identify those that have a potential therapeutic benefit for
 CC the treatment of neuropsychiatric and neurodegenerative disorders
 CC including schizophrenia, bipolar affective disorder (BAD) and autism, as
 CC well as Parkinson's and Alzheimer's disease. Accordingly, the compounds
 CC of this invention exhibit various activities including neuroleptic,
 CC nootropic, antianimic and antidepressant. Furthermore, the screening
 CC method used in MPHTS will be automated, such that a large number of test
 CC compounds may be rapidly screened with a minimal amount of labour and
 CC effort. This polynucleotide is a human cDNA sequence of a gene that is
 CC differentially expressed in the presence of a therapeutic compound and
 CC represents an exemplary efficacy gene for bipolar affective disorder,
 CC given in an exemplification of the invention.

 PT responsible for genetic disorders or other traits and to assess
 PT biodiversity.
 XX

PS Claim 1; SEQ ID NO 22979; 103pp; English.

XX The invention relates to isolated polynucleotide (I) and polypeptide (II)
 CC sequences. (I) is useful as hybridisation probes, polymerase chain
 CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
 CC and in recombinant production of (II). The polynucleotides are also used
 CC in diagnostics as expressed sequence tags for identifying expressed
 CC genes. (I) is useful in gene therapy techniques to restore normal
 CC activity of (II) or to treat disease states involving (II). (II) is
 CC useful for generating antibodies against it, detecting or quantitating a
 CC polypeptide in tissue, as molecular weight markers and as a food
 CC supplement. (II) and its binding partners are useful in medical imaging
 CC of sites expressing (II). (I) and (II) are useful for treating disorders
 CC involving aberrant protein expression or biological activity. The
 CC polypeptide and polynucleotide sequences have applications in
 CC diagnostics, forensics, gene mapping, identification of mutations
 CC and to produce other types of data and products dependent on DNA and
 CC amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
 CC coding sequences of the invention. Note: The sequence data for this
 CC patent did not appear in the printed specification, but was obtained in

 XX
 XX 830 Primers useful for synthesizing full length cDNA clones and their use
 PT in genetic manipulation.
 XX
 XX Claim 8; SEQ ID NO 2864; 1380pp + Sequence Listing; English.
 XX
 CC The invention relates to primers for synthesizing full length cDNA
 CC clones. 830 cDNA molecules encoding a human protein have been isolated
 CC and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have
 CC been determined. Primers for synthesizing the full length cDNA are useful
 CC for clarifying the function of the protein encoded by the cDNA. The full
 CC length clones were obtained by construction of full length enriched cDNA
 CC libraries that were synthesised by the oligo-capping method. The primers
 CC enable the production of the full length cDNA easily without any special
 CC methods. The present sequence is a full length human cDNA of the
 CC invention. Note: The sequence data for this patent did not form part of
 CC the printed specification, but was obtained in CD-ROM format directly
 CC from EPO

XX New oligonucleotide primers (830 cDNAs) useful for synthesizing full
 PT length human cDNAs.
 XX
 XX Example 1; SEQ ID NO 2864; 1340pp; English.
 XX
 CC This invention relates to a novel primers useful for synthesising full
 CC length cDNA molecules that encode human proteins. Specifically, it refers
 CC to secretory or membrane proteins that are potential therapeutic agents/
 CC target molecules in the field of medicine, and in particular genes
 CC encoding proteins that are associated with signal transduction,
 CC glycoproteins and transcription. The present invention describes a method
 CC for efficiently cloning a full length human cDNA from both the 5' and 3'
 CC ends using the oligo-capping method. This polynucleotide sequence is a
 CC full length human cDNA clone of the invention.

XX 830 Primers useful for synthesizing full length cDNA clones and their use
 PT in genetic manipulation.

XX Claim 8; SEQ ID NO 2866; 1380pp + Sequence Listing; English.

XX The invention relates to primers for synthesising full length cDNA
 CC clones. 830 cDNA molecules encoding a human protein have been isolated
 CC and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have
 CC been determined. Primers for synthesising the full length cDNA are useful

CC for clarifying the function of the protein encoded by the cDNA. The full
 CC length clones were obtained by construction of full length enriched cDNA
 CC libraries that were synthesised by the oligo-capping method. The primers
 CC enable the production of the full length cDNA easily without any special
 CC methods. The present sequence is a full length human cDNA of the
 CC invention. Note: The sequence data for this patent did not form part of
 CC the printed specification, but was obtained in CD-ROM format directly
 CC from EPO

XX New signal transducer and activator of transcription 6 activation
 PT promoting purified protein, for diagnosing and treating disease
 PT associated with activation/inhibition of transcription factor e.g.
 PT diabetes and cancer.

XX PS Claim 4; SEQ ID NO 127; 1368pp; English.

XX The invention relates to a purified protein promoting signal transducer
 CC and activator of transcription 6 activation (STAT6). The protein is

CC useful for the producing an antibody, which involves administering the
 CC protein or its epitope-bearing fragments to a non-human animal as an
 CC antigen. The nucleic acid is useful for diagnosing a disease or
 CC susceptibility to a disease related to expression or activity of the
 CC protein. A transformant expressing the protein is useful for screening
 CC compounds which inhibit or promote STAT6 activation. A transformant
 CC expressing the protein is useful for producing a pharmaceutical
 CC composition. Compositions, antibodies and antisense molecules are useful
 CC for the treating a disease associated with STAT6 activation such as
 CC allergic diseases, inflammation, autoimmune diseases, diabetes,
 CC hyperlipidaemia, infections disease and cancers. Compositions are useful
 CC for treating disease associated with STAT6 activation and/or prevention
 CC of Th1 hyperactive diseases. Compositions are also useful in rheumatoid
 CC arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,
 CC allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,
 CC viral hepatitis and AIDS. The protein has effectively promoting STAT6
 CC activity. The protein or nucleic acid is effectively useful for screening
 CC compounds for treating and preventing disease associated with excessive
 CC activation or inhibition of STAT6. The present sequence represents a
 CC human cDNA encoding a protein which promotes STAT6 activation.

XX The invention relates to Enterococcus faecalis polynucleotides and polypeptides. The invention also relates to a recombinant expression vector comprising a polynucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for producing an E. faecalis polypeptide, an isolated nucleic acid comprising a sequence not given in the specification, a recombinant vector comprising the nucleic acid and a cell comprising the recombinant vector. The polynucleotides can be used to detect the presence of E. faecalis in a sample. The sequences are useful for preparing a composition for diagnosing or treating Enterococcus faecalis infection. This sequence represents an E. faecalis polynucleotide of the invention.

XX Claim 1; SEQ ID NO 13127; 21pp + Sequence Listing; English.

XX The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA

CC sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the CC printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

XX Sequence 1058 BP; 298 A; 288 C; 259 G; 213 T; 0 U; 0 Other;

XX New recombinant DNA constructs useful in the field of biochemistry and
PT genetics, and in particular for producing transgenic plants with improved
PT biological characteristics.
XX Claim 1; SEQ ID NO 642; 14pp; English.
XX The invention relates a recombinant DNA construct comprising a
CC polynucleotide having any of 5544 nucleotide sequences (cDNAs SEQ ID NO:
CC 1-5544) and encoding a polypeptide with any of 5544 amino acid sequences
CC (SEQ ID NO: 5545-11088). The cDNAs and proteins are from corn, soybean,
CC Arabidopsis, wheat and rape but the specification does not indicate which
CC sequences is derived from which organism. Also included is a method of
CC producing a plant having an improved property, comprising transforming a
CC plant with a recombinant DNA construct comprising a promoter region
CC functional in a plant cell operably joined to a polynucleotide encoding a
CC polypeptide associated with the property, and growing the transformed
CC plant. The property is selected from improving plant cold tolerance, for
CC manipulating growth rate in plant cells by modification of the cell cycle
CC pathway, for improving plant drought tolerance, for providing increased
CC resistance to plant disease, for galactomannan production, for production
CC of plant growth regulators, for improving plant heat tolerance, for
CC improving plant tolerance to herbicides, for increasing the rate of
```

CC homologous recombination in plants, for lignin production, for improving
CC plant tolerance to extreme osmotic conditions, for improving plant
CC tolerance to pathogens or pests, for yield improvement by modification of
CC photosynthesis, for modifying seed oil yield and/or content, for
CC modifying seed protein yield and/or content, for yield improvement by
CC modification of carbohydrate, nitrogen or phosphorus use and/or uptake
CC and for yield improvement by providing improved plant growth and
CC development under at least one stress condition. The polynucleotide may
CC also encode a plant transcription factor. The methods and compositions of
CC the present invention are useful in the field of biochemistry and
CC genetics, in particular for producing transgenic plants with improved
CC biological characteristics such as increased yield, improved nitrogen
CC flow, increasing plant tolerance to cold or heat, improving plant
CC tolerance to extreme osmotic and drought conditions, and improving plant
CC tolerance to plant pests or pathogens. They can also be used in physical
CC arrays of molecules, plant breeding markers, computer-based storage and
CC analysis systems. The present sequence is one of the 5544 plant cDNA
CC sequences of the invention. Note: The sequence data for this patent did
CC not form part of the printed specification, but was obtained in
CC electronic format directly from USPTO at
CC seqdata.uspto.gov/sequence.html?DocID=20040216190.

XX genes from Drosophila and for elucidating cell signalling and cell-cell
XX interactions.

PS Claim 1; SEQ ID NO 13124; 21pp + Sequence Listing; English.

XX The invention relates to an isolated nucleic acid detection reagent
CC capable of detecting 1000 or more genes from Drosophila. The invention is
CC useful in developmental biology and in elucidating cell signalling and
CC cell-cell interactions in higher eukaryotes for the development of
CC insecticides, therapeutics and pharmaceutical drugs. The invention
CC discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
CC sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-
CC ABB72072). The sequence data for this patent did not form part of the
CC printed specification, but was obtained in electronic format directly

XX CC Chemically modified sequences of genes associated with apoptosis are

XX PT useful to determine methylation patterns of genomic DNA samples for

XX PT diagnosis of associated diseases such as cancer.

XX PS Claim 1; Seq ID #55; 24pp; English.

XX CC This invention relates to chemically pre-treated DNA of genes associated
 CC with apoptosis. The nucleic acids are used to allocate patients for
 CC specific therapy for HIV infection, Bloom syndrome, cardiopathy, aging,
 CC neurodegenerative disorders, Herpes simplex virus infection, renal
 CC ischaemia, amyotrophic lateral sclerosis, solid tumours and cancers. This
 CC nucleotide sequence represents a chemically treated apoptosis gene. Even
 CC SEQ ID numbers are the complementary DNA strands to the odd SEQ ID
 CC numbers. The sequence data for this patent is not represented in the
 CC printed specification but is based on information supplied by the
 CC European patent office

XX PT used to develop products for the detection of Enterococcus and for use in

XX PS vaccines for prevention or attenuation of Enterococcus infection.

XX PS Claim 1; Page 1592-1609; 2084pp; English.

XX CC A computer readable medium has been developed which has recorded on it
 CC 982 nucleotide sequences isolated from the Enterococcus faecalis genome.
 CC AAAX12938 to AAAX13919 represent these nucleotide sequences which are
 CC primary nucleotide sequences, also known as contigs. The computer-based
 CC system can identify fragments of the Enterococcus faecalis genome with
 CC commercial importance. The products can be used to detect the presence of
 CC Enterococcus faecalis in samples. They can also be used for diagnosing
 CC Enterococcal infection in an animal and monitoring progression of
 CC disease, and for identifying agents which can be used to modulate the
 CC growth or pathogenicity of Enterococcus faecalis, or another related
 CC organism, in vivo or in vitro. In particular the polypeptides encoded by
 CC the Enterococcus faecalis nucleotide sequences can be used in vaccines to
 CC prevent or attenuate an Enterococcal infection

XX Recombinant nucleic acid useful for diagnosis and treatment of carcinoma comprises a nucleotide sequence.

PT Claim 1; SEQ ID NO 238; Opp; English.

XX

PS The present invention relates to novel DNA and protein sequences which are associated with carcinomas. The sequences are useful for: (i) for screening drug candidates; (ii) for screening of bioactive agent capable of binding to Carcinoma Associated Protein (CAP); (iii) for screening of a bioactive agent capable of modulating the activity of CAP; (iv) for evaluating the effect of a candidate carcinoma drug; (v) for diagnosing carcinoma; (vi) for inhibiting the activity of CAP; (vii) for treating carcinoma; (viii) for neutralizing the effect of CAP; (ix) as a biochip; (x) for diagnosing carcinoma or a propensity to carcinoma; and (xi) for determining Carcinoma Associated (CA) gene copy number. In addition, the CA genes are useful as DNA vaccines and the CAP are useful as markers of carcinoma including lymphoma. The present sequence is one such CA coding sequence. Note: This patent is an equivalent to basic patent US2002182586A1, for which no sequence data was published

HSJ492P14 121909 bp DNA linear PRI 18-MAY-2005
LOCUS HSJ492P14
DEFINITION Human DNA sequence from clone RP3-492P14 on chromosome 6q13-15
Contains a single stranded DNA binding protein pseudogene, the TPBG
gene for trophoblast glycoprotein (574-AG) and a CpG island,
complete sequence.
ACCESSION AL121977
VERSION AL121977.11 GI:11863678
KEYWORDS HTG; CpG island; TPBG.
SOURCE Homo sapiens (human)
ORGANISM Homo sapiens
Eukaryota; Metazoa; Chordata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Euarchontoglires; Primates; Catarrhini;
Homnidae; Homo.
1 (bases 1 to 121909)
Direct Submission
Submitted (13-MAY-2005) Wellcome Trust Sanger Institute, Hinxton,
Cambridgeshire, CB10 1SA, UK. E-mail enquiries: vegas@sanger.ac.uk
Clone requests: clonerequest@sanger.ac.uk
On Dec 15, 2000 this sequence version replaced gi:11558491.
The following abbreviations are used to associate primary accession
numbers given in the feature table with their source databases:
Em., ENBL; Sw., SWISSPROT; Tr., TREMBL; Wp., WORMPEP; Information
on the WORMPEP database can be found at
http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence
was generated from part of bacterial clone contigs of human
chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping

```

Group. Further information can be found at <http://www.sanger.ac.uk/HGP/Chr6>
 RP3-492P14 is from the library RPCI-3 constructed by the group of
 Pieter de Jong. For further details see

This sequence was finished as follows unless otherwise noted: all
 regions were either double-stranded or sequenced with an alternate
 chemistry or covered by high quality data (i.e., phred quality >=
 30); an attempt was made to resolve all sequencing problems, such
 as compressions and repeats; all regions were covered by at least
 one subclone; and the assembly was confirmed by restriction digest,
 except on the rare occasion of the clone being a YAC.

>=30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone, fosmid clone or direct clone walk sequence. Sequence from the Mouse Genome Sequencing Consortium whole genome shotgun may have been used to obtain the consensus sequence. The assembly was confirmed by restriction digest.

This finishing standard has slightly changed from the previous Human standard. Specifically, standards for regions of low sequence complexity (such as dinucleotide repeats and small unit tandem repeats) have been relaxed. These regions are very prevalent in the mouse genome, and the return on extended finishing efforts is minimal.

If a sequence meets the criteria of the above statement, it needs no comments or tags. If the criteria are not met, such as ambiguous bases, then the region is duly annotated.

MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see <http://genome.wustl.edu>

SOURCE INFORMATION:

The BAC Library has been constructed by Pieter de Jong and coworkers (<http://www.chori.org>) from male C57BL/6J mouse spleen and/or brain genomic DNA. The clone and detailed information can be obtained from Pieter de Jong and coworkers at <http://www.chori.org>

This sequence is the entire insert of the clone.

3 (bases 1 to 208985)

Cow Genome Sequencing Consortium.

Direct Submission

Submitted (01-JUL-2005) Human Genome Sequencing Center, Department

of Molecular and Human Genetics, Baylor College of Medicine, One

Baylor Plaza, Houston, TX 77030, USA

On Jun 28, 2005 this sequence version replaced gi:57900766.

The sequence in this assembly is a combination of BAC based reads

and whole genome shotgun sequencing reads assembled using Atlas

(<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described

in the feature table below represents a scaffold in the Atlas

assembly (a 'contig-scaffold'). Within each contig-scaffold,

individual sequence contigs are ordered and oriented, and separated

by sized gaps filled with Ns to the estimated size. The sequence

may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

Contact: hgsc-help@bcm.tmc.edu
----- Project Information
Center project name: FCLO
Center clone name: CH240-40N24
----- Summary Statistics

Assembly program: Atlas 3.0;
Consensus quality: 203744 bases at least Q40
Consensus quality: 205219 bases at least Q30
Consensus quality: 206413 bases at least Q20
Estimated insert size: 209875; sum-of-contigs estimation
Quality coverage: 7x in Q20 bases; sum-of-contigs estimation

* NOTE: Estimated insert size may differ from sequence length
* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
* NOTE: This is a 'working draft' sequence. It currently
* consists of 13 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

* 1 20170: contig of 20170 bp in length
* 20171 20220: gap of 50 bp

Cow Genome Sequencing Consortium.
Direct Submission
Submitted (01-JUL-2005) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
On Jun 28, 2005 this sequence version replaced gi:58531453.
The sequence in this assembly is a combination of BAC based reads
and whole genome shotgun sequencing reads assembled using Atlas
(<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described
in the feature table below represents a scaffold in the Atlas
assembly (a 'contig-scaffold'). Within each contig-scaffold,
individual sequence contigs are ordered and oriented, and separated
by sized gaps filled with Ns to the estimated size. The sequence
may extend beyond the ends of the clone and there may be sequence
contigs within a contig-scaffold that consist entirely of whole
genome shotgun sequence reads. Both end sequences and whole genome
shotgun sequence only contigs will be indicated in the feature
table.

 Cow Genome Sequencing Consortium.
 Direct Submission
 Submitted (01-JUL-2005) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
 On Jun 29, 2005 this sequence version replaced gi:67763874.
 The sequence in this assembly is a combination of BAC based reads

and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

 ----- Summary Statistics
 Assembly program: Atlas 3.0;
 Consensus quality: 209389 bases at least Q40
 Consensus quality: 211366 bases at least Q30
 Consensus quality: 211128 bases at least Q20
 Estimated insert size: 212035; sum-of-contigs estimation
 Quality coverage: 7x in Q20 bases; sum-of-contigs estimation

 * NOTE: Estimated insert size may differ from sequence length
 * (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
 * NOTE: This is a 'working draft' sequence. It currently
 * consists of 9 contigs. The true order of the pieces
 * is not known and their order in this sequence record is
 * arbitrary. Gaps between the contigs are represented as
 * runs of N, but the exact sizes of the gaps are unknown.
 * This record will be updated with the finished sequence
 * as soon as it is available and the accession number will
 * be preserved.
 * 1
 * 2953 3149: contig of 2952 bp in length
 * 3150 34920: contig of 31771 bp in length
 * 34921 34970: gap of 50 bp
 * 34971 54700: contig of 19730 bp in length
 * 54701 54750: gap of 50 bp
 * 54751 56234: contig of 1484 bp in length
 * 56235 56528: gap of 294 bp
 * 56529 74429: contig of 17901 bp in length
 * 74430 74479: gap of 50 bp
 * 74480 85346: contig of 10867 bp in length
 * 85347 85396: gap of 50 bp
 * 85397 102085: contig of 16689 bp in length
 * 102086 102135: gap of 50 bp
 * 102136 211461: contig of 109326 bp in length
 * 211462 211561: gap of unknown length
 * 211562 212987: contig of 1426 bp in length.

```

* NOTE: This record contains 74 individual
 * sequencing reads that have not been assembled into
 * contigs. Runs of N are used to separate the reads
 * and the order in which they appear is completely
 * arbitrary. Low-pass sequence sampling is useful for
 * identifying clones that may be gene-rich and allows
 * overlap relationships among clones to be deduced.
 * However, it should not be assumed that this clone
 * will be sequenced to completion. In the event that
 * the record is updated, the accession number will
 * be preserved.

 XX
 XX New oligonucleotide libraries comprising oligonucleotides which
 PT selectively hybridize to mRNAs transcribed from a transcription unit of a
 PT genome, useful for detecting tissue-, pathology-, and developmental-
 PT specific genes.
 XX
 XX Example 1; SEQ ID NO 29022; 47pp; English.
 PS
 CC The present invention describes oligonucleotide libraries for detecting
 CC messenger RNAs that populate a (sub-)transcriptome, where the (sub-
 CC)transcriptome comprises messenger RNAs transcribed from multiple
 CC transcription units that populate a genome. The library comprises several
 CC oligonucleotides, each capable of hybridising selectively to a set of
 CC messenger RNAs transcribed from a given transcription unit of the genome,
 CC which encodes one or more messenger RNA splice variants. The
 CC oligonucleotide libraries are useful for detecting mRNAs from a
 CC biological sample, in expression profiling studies, in qualitatively or
 CC quantitatively characterising the corresponding transcriptome, and in
 CC detecting RNA transcripts and splice variants of human or animal
 CC transcriptomes. The libraries may also be used as specialised mini
 CC libraries to detect transcripts of a sub-transcriptome under a particular
 CC biological or pathological state, and so allowing the detection of tissue
 CC - and pathology-specific genes such as those genes only expressed in
 CC specific tissue under a specific pathological condition; to detect
 CC developmental specific genes; and to detect RNA transcripts and splice
 CC variants of a transcriptome of a patient suffering from a particular
 CC disorder. ABN7253 to ABN59589 represent oligonucleotide sequences from
 CC rats, humans and mice, which are used in the exemplification of the
 CC present invention. N.B. The sequence data for this patent did not form
 CC part of the printed specification, but was obtained in electronic format
 CC directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

 XX PT Determining open reading frames of genome of an organism e.g. a human
 XX PT suffering from cancer involves use of single oligonucleotide primer at
 XX PT low stringency for preparing single-stranded cDNA from mRNA of
 XX PT individual.
 XX PS Example 9; Page 866; 959pp; English.
 XX CC The invention describes a method of determining open reading frames in
 CC the genome of organism, comprising contacting mRNA from cell of organism
 CC with a single oligonucleotide primer (I) at low stringency, preparing
 CC single-stranded cDNA by reverse transcribing mRNA with (I), amplifying
 CC cDNA, sequencing the product, and repeating the contacting, preparing
 CC and amplifying steps with different primers and sequencing resulting
 CC nucleic acids. The method is useful for: determining that a known
 CC nucleotide sequence from a genome of an organism corresponds to a
 CC nucleotide sequence of an open reading frame; for preparing a contig,
 CC nucleic acid molecule from a genome of an organism; and for sequencing
 CC all or part of a genome of an organism. mRNA is obtained from mammalian
 CC or human cell which is associated with a pathological condition e.g. a
 CC colon cancer or breast cancer cell. The method is useful for analyses of
 CC populations of subjects and can be used to carry out genetic analyses of
 CC large or small populations. Further, it can be used to study living
 CC systems to determine if, e.g. there have been genetic shifts which render
 CC an individual or population more or less likely to be afflicted with
 CC diseases such as cancer, to determine antibiotic resistance or non-
 CC tolerance, and so forth. The method can also be used in the study of
 CC congenital diseases, and the risk of affliction to a foetus, as well as
 CC the study of whether the conditions are likely to be passed to offspring
 CC through ova or sperm. The analyses for pathological conditions can be
 CC carried out in all animals, plants, birds, fish, etc. Using this method,
 CC in the area of agriculture, for example the genomes of food crops can be
 CC studied to determine if resistance genes are present, defects in plant
 CC genomes can also be studied in this way. Similarly, the method permits
 CC determination of the pathogens which integrate into the genome, such as
 CC retroviruses and other integrating viruses such as influenza virus, have
 CC undergone shifts or mutations, which may require different approaches to
 CC therapy. This method is also applied to eukaryotic pathogens, such as
 CC trypanosomes, different types of Plasmodium, etc. The method essentially
 CC eliminates sequencing of non-coding portions. This sequence represents a
 CC polynucleotide isolated from human colon cancer cell cDNA library

 XX CC New isolated polynucleotide and encoded polypeptides, useful in
 CC diagnostics, forensics, gene mapping, identification of mutations
 CC responsible for genetic disorders or other traits and to assess
 CC biodiversity.
 XX Claim 1; SEQ ID NO 22978; 103pp; English.
 XX The invention relates to isolated polynucleotide (I) and polypeptide (II)
 CC sequences. (I) is useful as hybridisation probes, polymerase chain
 CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
 CC and in recombinant production of (II). The polynucleotides are also used
 CC in diagnostics as expressed sequence tags for identifying expressed
 CC genes. (II) is useful in gene therapy techniques to restore normal
 CC activity of (II) or to treat disease states involving (II). (II) is
 CC useful for generating antibodies against it, detecting or quantitating a
 CC polypeptide in tissue, as molecular weight markers and as a food
 CC supplement. (II) and its binding partners are useful in medical imaging
 CC of sites expressing (II). (I) and (II) are useful for treating disorders
 CC involving aberrant protein expression or biological activity. The
 CC polypeptide and polynucleotide sequences have applications in
 CC diagnostics, forensics, gene mapping, identification of mutations
 CC responsible for genetic disorders or other traits to assess biodiversity
 CC and to produce other types of data and products dependent on DNA and
 CC amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
 CC coding sequences of the invention. Note: The sequence data for this
 CC patent did not appear in the printed specification, but was obtained in
 CC electronic format directly from WIPO at

XX
XX A method, useful for prognosing and treating solid tumor, comprises
XX comparing an expression profile of a gene expressed in peripheral blood
XX mononuclear cells to a reference expression profile of a gene.
XX
XX
XX Disclosure; Page; 111pp; English.
XX
XX The invention describes a method comprising comparing an expression
XX profile of at least one gene in a peripheral blood sample of a patient to
XX at least one reference expression profile of the at least one gene, where
XX the patient has a solid tumour, and each of the gene is differentially
XX expressed in peripheral blood mononuclear cells (PBMCs) of a first class
XX of patients as compared to PBMCs of a second class of patients, where
XX both the first and second classes of patients have the solid tumour, and
XX each of the first and second classes is a subcluster formed by an
XX unsupervised clustering analysis of gene expression profiles in PBMCs of
XX a population of patients who have the solid tumour, and where the
XX majority of the first class of patients has a first clinical outcome, and
XX the majority of the second class of patients has a second clinical
XX outcome. Also described are: a system comprising (i) a memory or a
XX storage medium including data that represent an expression profile of at
XX least one gene in a peripheral blood sample of a patient who has a solid
XX tumour, (ii) at least another storage medium including data that
XX represent at least one reference expression profile of the gene, (iii) a
XX program capable of comparing the expression profile to the reference
XX expression profile, and (iv) a processor capable of executing the
XX program, where expression levels of the gene in peripheral blood
XX mononuclear cells of patients who have the solid tumour correlate with
XX clinical outcomes of the patients; and a nucleic acid or protein array
XX comprising concentrated probes for solid tumour prognosis genes, where
XX each of the solid tumour prognosis genes is differentially expressed in
XX PBMCs of a first class of patients as compared to PBMCs of a second class
XX of patients, where both the first and second classes of patients have a
XX solid tumour, and where the first class of patients has a first clinical
XX outcome, and the second class of patients has a second clinical outcome.
XX The method, system, and array are useful for prognosing and treating
XX solid tumours. This sequence represents a solid tumour prognosis gene of
XX the invention. Note: The sequence data for this patent did not form part

CC of the printed specification, but was obtained in electronic format
CC directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

 PT Detecting a lung cancer-associated transcript in a cell from a patient
 PT for treating lung cancer, by contacting a biological sample from the
 PT patient with a polynucleotide that exhibits increased or decreased
 PT expression in lung cancer.
 XX
 XX Claim 22; Page 336; 453pp; English.
 XX
 XX The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridizes
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, and
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

 XX
 XX Detecting an ovarian cancer-associated transcript in a cell from a
 PT patient, comprises contacting a biological sample from the patient with a
 PT polynucleotide that hybridizes to an ovarian cancer gene.
 XX
 XX Claim 10; Page 297; 332pp; English.
 XX
 CC The invention relates to a method of detecting an ovarian cancer-
 CC associated transcript in a cell from a patient, by contacting a
 CC biological sample from the patient with a polynucleotide that selectively
 CC hybridizes to a sequence at least 80% identical to any of one of 80
 CC nucleic acid sequences given in the specification. The method is useful
 CC in diagnosing ovarian cancer and in identifying and using agents and/or
 CC targets that inhibit ovarian cancer. The nucleic acid molecule,
 CC polypeptide and the antibody may also be used in detecting ovarian
 CC cancers, monitoring and early detection of relapse following treatment,
 CC monitoring response to therapy, selecting patients for post-operative
 CC chemotherapy or radiation therapy, in selecting mode of therapy,
 CC determining tumour prognosis, early detection of pre-cancerous lesions,
 CC and as vaccines. This sequence corresponds to one of the nucleic acids
 CC used for the detection method of the invention.

XX Determining the presence or absence of a pathological cell in a patient,
PT useful for diagnosing, prognosing or treating cancer, comprises detecting
PT a nucleic acid in a biological sample.
XX
XX Claim 8; SEQ ID NO 41; 1385pp; English.
XX
XX The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
CC whose expression is upregulated or downregulated in specific cancers or

CC other diseases such as angiogenic or fibrotic disorders, and to methods
CC of determining the presence or absence of a pathological cell in a
CC patient by detecting a nucleic acid at least 80% identical to those of
CC the invention or by detecting a polypeptide of the invention. The
CC invention also relates to expression vectors and host cells comprising a
CC nucleic acid of the invention; antibodies which specifically bind a
CC polypeptide of the invention; use of such antibodies for drug targeting;
CC and methods of screening for modulators of activity or expression of the
CC polypeptides and nucleic acids. The nucleic acids, polypeptides, and
CC antibodies and methods are useful for diagnosing, prognosing and treating
CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
CC neovascularisation syndromes, scarring and uterine fibroids. They may
CC also be useful in wound healing and in contraception. The present
CC sequence represents a nucleic acid sequence of the invention.

XX
XX The invention relates to a method of identifying a candidate p53 pathway
CC modulating agent. The method involves contacting an assay system
CC comprising a purified Leucine rich repeat, capricious related (LRRCAPS)

CC polypeptide or nucleic acid or its fragment with a test agent and
 CC detecting a test agent-biased activity, where a difference between the
 CC test agent-biased activity and the reference activity identifies the test
 CC agent as a candidate p53 pathway modulating agent. The method is useful
 CC for identifying a candidate p53 pathway-modulating agent for preparing a
 CC composition for diagnosing or treating cancer. The invention is useful in
 CC gene therapy. The present sequence is human LRRCAPS related DNA

XX New NOVX polypeptides and polynucleotides, useful for preventing,
 PT diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer,
 PT Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic
 PT disorders, and asthma.

XX Claim 16; Page 114-115; 619pp; English.

XX The present invention relates to new isolated proteins (NOVX) and their
 CC coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is
 CC any number from 1 to 48. The NOVX proteins and coding sequences are
 CC useful in the manufacture of a medicament for treating a syndrome
 CC associated with a human disease, preferably a NOVX-associated disorder.
 CC The NOVX coding sequences and proteins are useful for treating, diabetes,
 CC preventing or diagnosing diseases such as metabolic disorders, diabetes,
 CC obesity, infectious disease, anorexia, cancer-associated cachexia,
 CC cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's
 CC disease, immune disorders, haematopoietic disorders, cardiovascular

CC disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic
 CC disturbances associated with obesity, metabolic syndrome X or wasting
 CC disorders associated with chronic diseases or various cancers. The NOVX
 CC coding sequences and proteins may also be used as targets for the
 CC identification of small molecules that modulate or inhibit e.g.
 CC neurogenesis, cell differentiation, cell proliferation, haematopoiesis,
 CC wound healing and angiogenesis, in gene therapy, in generation of
 CC antibodies that bind immunospecifically to NOVX substructures for use in
 CC therapeutic or diagnostic methods

XX Novel canine or feline 5T4 polypeptide and polynucleotides encoding the
 PT polypeptide, useful in preparation of vaccine for treating and/or
 PT preventing cancer in a subject, preferably a dog or cat.

PS Claim 4; Page 68; 68pp; English.

XX The present invention relates to the isolation of canine and feline
 CC oncofoetal leucine-rich glycoproteins known as 5T4, and the
 CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in
 CC a significant proportion of tumours. The sequences of the invention are

CC useful in a pharmaceutical composition for the prevention and/or
 CC treatment of tumours or other diseases associated with cell
 CC proliferation, infections, and inflammatory conditions in animals,
 CC preferably dogs or cats. The compositions may also be used for cancer
 CC immunotherapy in these animals. The sequences of the invention may also
 CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
 CC measurement and localisation of 5T4 in extracts of plasma, urine,
 CC tissues, and in cell culture media. Antibodies specific for the 5T4
 CC protein are useful for isolating foetal cells from maternal blood. The
 CC isolation process may form part of a diagnostic method e.g. the foetal
 CC cells may then be subject to biochemical or genetic sampling used for
 CC testing foetal abnormalities, or to determine the sex of the foetus(es).

XX New major histocompatibility complex class I peptide epitopes from human
 PT 5T4 tumor-associated antigen, useful for preventing and/or treating a
 PT disease, particularly cancer.

XX Disclosure; Page 67; 73pp; English.

XX The invention relates to a novel Major Histocompatibility Complex (MHC)

CC class I peptide epitope of the 5T4 antigen. The invention further
 CC provides a polypeptide string comprising the 5T4 epitope; a nucleic acid
 CC sequence encoding the 5T4 epitope or a polypeptide string of the 5T4
 CC epitope; a vector system capable of delivering the 5T4 epitope nucleic
 CC acid to a cell; a cell pulsed with the 5T4 epitope; a polypeptide of the
 CC 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine
 CC comprising the above; a method for treating and/or preventing a disease
 CC in a subject by administering the vaccine; an agent capable of binding
 CC specifically to the 5T4 epitope and/or its encoding nucleic acid; a method
 CC comprising detecting the presence of the 5T4 epitope or its encoding
 CC nucleic acid in a subject; and a T cell line or clone capable of
 CC specifically recognising the 5T4 epitope in conjunction with an MHC class
 CC I molecule. The 5T4 epitope has cytostatic activity. The vaccine
 CC comprising the 5T4 epitope or its encoding nucleic acid and the vector
 CC system or cell is useful in the prevention and/or treatment of a disease,
 CC particularly cancer. The detection method is useful for diagnosing or
 CC monitoring the progression of a cancerous disease, and for detecting the
 CC presence of the 5T4 epitope or its nucleic acid. The T cell line or clone
 CC is useful in the manufacture of a medicament for treating and/or
 CC preventing a disease. This polynucleotide sequence represents the feline
 CC 5T4 antigen coding DNA of the invention.

PT New Major Histocompatibility Complex class II peptide epitope of 5T4,
 PT useful for manufacturing a medicament for diagnosing, preventing and/or
 PT treating a disease, e.g. cancer.

XX PS Disclosure; Page 49; 63pp; English.

XX CC The invention relates to a Major Histocompatibility Complex (MHC) class
 CC II peptide epitope of the 5T4 antigen. The vaccine or T-cell line or
 CC clone has a cytostatic activity, as it is useful in manufacturing a
 CC medicament for preventing and/or treating a disease, particularly cancer.
 CC The methods are useful for detecting T-cells capable of specifically
 CC recognising a peptide epitope in conjunction with an MHC molecule, for
 CC diagnosing or monitoring the progression of a cancerous disease, or for
 CC detecting the presence of a peptide or nucleic acid using an agent. The
 CC MHC class II peptide epitope of the invention can be used in gene therapy
 CC or as part of a vaccine. This polynucleotide sequence represents the DNA
 CC coding for the feline 5T4 protein.

XX PT Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
 PT response useful in vaccinating against and in treating tumors.

XX PS Example 2; Page 78; 79pp; English.

XX CC The present sequence encodes the human 5T4 tumour-associated antigen
 CC (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in

CC carcinomas but has a highly restricted expression pattern in normal adult
CC tissues. It appears to be strongly correlated to metastasis in colorectal
CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
CC induced were inoculated with a virus expression vector containing the
CC present sequence. The 5T4 antigen was shown to be effective at eliciting
CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
CC the antigen and the antigen itself can be used to elicit an immune
CC response, preferably CTL or an antibody response in a subject

XX Use of single chain antibody capable of recognizing a disease associated

XX molecule for manufacturing a medicament for preventing and/or treating a

XX disease condition associated with disease associated molecule.

XX Disclosure; Fig 26; 118pp; English.

XX

CC The specification describes the use of a single chain antibody (ScFv),
CC which is capable of recognizing a disease associated molecule in the
CC manufacture of a medicament for the prevention and treatment of a disease
CC condition. The ScFv antibody is useful in the manufacture of a
CC medicament, for affecting a disease in vivo, for preparing a
CC pharmaceutical composition, for in vivo imaging and/or for adjuvant
CC treatment of a disease. The ScFv antibody is also useful for treating
CC inflammatory diseases including arthritis, hypersensitivity, autoimmune
CC diseases, cancers, central nervous system disorders including Parkinson's
CC disease, periodontal diseases, cardiopulmonary diseases, cardiovascular
CC diseases, gastrointestinal disorders, infections, diabetes, Helicobacter-
CC related diseases, and other immune disorders. The present sequence
CC encodes a 5T4 protein, which is used to produce ScFv of the invention

 XX Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
 PT response useful in vaccinating against and in treating tumors.
 XX Example 2; Page 78; 79pp; English.
 XX The present sequence encodes the mouse 5T4 tumour-associated antigen
 CC (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
 CC

CC carcinomas but has a highly restricted expression pattern in normal adult
 CC tissues. It appears to be strongly correlated to metastasis in colorectal
 CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
 CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
 CC induced were inoculated with a virus expression vector containing the
 CC present sequence. The 5T4 antigen was shown to be effective at eliciting
 CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
 CC the antigen and the antigen itself can be used to elicit an immune
 CC response, preferably CTL or an antibody response in a subject. The
 CC present sequence appears in GenBank at accession number AJ012160

 XX Identifying a candidate p53 pathway-modulating agent for treating cancer
 PT comprises contacting an assay system comprising a purified leucine rich
 PT repeat, capricious related polypeptide or nucleic acid with a test agent.
 XX Disclosure; Page 75-76; 99pp; English.
 XX The invention relates to a method of identifying a candidate p53 pathway
 CC modulating agent. The method involves contacting an assay system
 CC comprising a purified leucine rich repeat, capricious related (LRRCAPS)
 CC polypeptide or nucleic acid or its fragment with a test agent and
 CC detecting a test agent-biased activity, where a difference between the
 CC test agent-biased activity and the reference activity identifies the test
 CC agent as a candidate p53 pathway modulating agent. The method is useful
 CC for identifying a candidate p53 pathway-modulating agent for preparing a

CC composition for diagnosing or treating cancer. The invention is useful in
CC gene therapy. The present sequence is human LRRCAPS related DNA

PT cancers, or for diagnosing, staging or monitoring the treatment of the
PT cancer.

XX
PS Claim 1; SEQ ID NO 105; 27pp; English.

XX
CC This invention relates to novel isolated cDNAs that are differentially
CC expressed in MYCN activated cells. Specifically, it refers to
CC polynucleotide sequences that exhibit differential expression patterns in
CC cells activated by the transactivator MYCN, where MYCN is a proto-
CC oncogene that is amplified in neuroblastoma cells and is common in small
CC cell lung cancers. The present invention describes these cDNA molecules
CC as useful for in hybridisation assays to detect expression of nucleic
CC acids (or complementary nucleic acids) in a present in a given sample, as
CC well as for screening assays by identifying molecules or compounds that
CC specifically bind the cDNA as a ligand and modulate function or activity.
CC Accordingly, these compositions exhibit cytostatic activity and can also
CC be used for gene therapy purposes. This polynucleotide sequence is a cDNA
CC that is differentially expressed in MYCN activated cells, given in an
CC exemplification of the invention. NOTE: This sequence does not appear in

CC the printed specification but has been obtained in electronic format from
CC the US Patent Office at
CC ftp.seqdata.uspto.gov/sequence.html?DocID=20030119009.

PT Detecting a bladder cancer-associated transcript in a cell from a
PT patient, comprises contacting a biological sample from the patient with a
PT bladder cancer-associated polynucleotide or antibody.

XX
PS Claim 6; Page 296; 307pp; English.

XX
CC The present invention describes a method for detecting a bladder cancer-
CC associated transcript in a cell from a patient. The method comprises
CC contacting a biological sample from the patient with a polynucleotide
CC that selectively hybridises to a sequence that is 80 % identical to a
CC table of sequences (see ACC50951 to ACC51059). ACC50951 to ACC51059
CC encode the human bladder cancer-associated proteins given in ABR48146 to
CC ABR48242). Bladder cancer-associated sequences from the present invention
CC have cytostatic activities, and can be used in antisense gene therapy and
CC in vaccine production. The method can be used for detecting a bladder
CC cancer-associated transcript in a cell from a patient. The method is
CC useful in diagnosing or treating bladder cancer and in screening for
CC compounds that modulate bladder cancer, such as hormones or antibodies.
CC The nucleic acid molecules from the present invention may be used in
CC various screening and diagnostic methods, and for gene therapy, vaccine

CC and/or antisense/inhibition applications

XX Detecting a lung cancer-associated transcript in a cell from a patient

XX for treating lung cancer, by contacting a biological sample from the

XX patient with a polynucleotide that exhibits increased or decreased

XX expression in lung cancer.

XX Claim 22; Page 335; 453pp; English.

XX The invention relates to a method for detecting a lung cancer-associated

XX transcript in a cell from a patient, comprising contacting a biological

XX sample from the patient with a polynucleotide that selectively hybridizes

XX to a sequence that is at least 80 % identical to a gene that exhibits

XX increased or decreased expression in lung cancer samples. Lung cancer-

XX associated polynucleotides and polypeptides are used for identifying a

XX compound that modulates a lung cancer-associated polypeptide, for

XX inhibiting proliferation of a lung cancer-associated cell to treat lung

XX cancer in a patient and for treating a mammal having lung cancer by

XX administering a modulatory compound identified. The methods are useful

CC for treating lung cancer, such as small cell lung cancer, non-small cell

CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,

CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,

CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and

CC bronchiectasis. The genes, polynucleotides and polypeptides are useful

CC for diagnostic purposes and as targets for screening for therapeutic

CC compounds that modulate lung cancer, such as antibodies. Sequences

CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the

XX invention

XX PT Determining the presence or absence of a pathological cell in a patient,
 PT useful for diagnosing, prognosing or treating cancer, comprises detecting
 PT a nucleic acid in a biological sample.

XX PS Claim 8; SEQ ID NO 39; 1385pp; English.

XX CC The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
 CC whose expression is upregulated or downregulated in specific cancers or
 CC other diseases such as angiogenic or fibrotic disorders, and to methods
 CC of determining the presence or absence of a pathological cell in a

CC patient by detecting a nucleic acid at least 80% identical to those of
CC the invention or by detecting a polypeptide of the invention. The
CC invention also relates to expression vectors and host cells comprising a
CC nucleic acid of the invention; antibodies which specifically bind a
CC polypeptide of the invention; use of such antibodies for drug targeting;
CC and methods of screening for modulators of activity or expression of the
CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
CC antibodies and methods are useful for diagnosing, prognosing and treating
CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
CC neovascularisation syndromes, scarring and uterine fibroids. They may
CC also be useful in wound healing and in contraception. The present
CC sequence represents a nucleic acid sequence of the invention.

Classifying a breast cancer patient according to prognosis comprises determining the similarity between the level of expression of each of five genes in a cell sample taken from patient, to control levels.

PS Disclosure; SEQ ID NO 1305; 226pp; English.

The invention relates to a method of classifying a breast cancer patient according to prognosis by determining the similarity between the level of expression of each of five genes for which markers are listed in the specification, in a cell sample taken from the breast cancer patient, to control levels of expression for each respective five genes to obtain a patient similarity value. The methods are useful for classifying a breast cancer patient according to prognosis. Kits and computer program products are useful for data analysis using the diagnostic, prognostic and statistical methods of the invention. This sequence corresponds to a marker used in the method of the invention.

New tumor-associated antigenic target polypeptides and nucleic acids, useful in preparing a medicament for treating or detecting a proliferative disorder, e.g. breast, lung, colorectal, ovarian or prostate cancer or tumor.

XX Claim 1; SEQ ID NO 2070; 7273pp; English.

The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide sequences at least 80% identical to the TAT nucleic acids and polypeptides; expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, cancers of the central nervous system, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence represents a TAT nucleic acid of the invention

PT      Identifying a compound that can treat disease or disorders, such as, a
PT      neuropsychiatric disorder e.g., schizophrenia, or autism, comprises
PT      determining the expression of one or more efficacy genes in a cell
PT      contacted with the test compound.
XX
PS      Example 6; SEQ ID NO 174; 39pp; English.
XX
CC      This invention relates to a novel screening method identified as a multi-
CC      parameter high throughput screening (MPHTS) assay. Specifically, it
CC      refers to an assay that utilizes the disease signature of a plurality of
CC      specific genes associated with a particular disease, and identifies
CC      differential expression between those cells taken from individuals
CC      affected by that disease and those that are not affected. The present
CC      invention then describes the screening of candidate pharmaceutical
CC      compounds to identify those that have a potential therapeutic benefit for
CC      the treatment of neuropsychiatric and neurodegenerative disorders
CC      including schizophrenia, bipolar affective disorder (BAD) and autism, as
CC      well as Parkinson's and Alzheimer's disease. Accordingly, the compounds
CC      of this invention exhibit various activities including neuroleptic,
CC      nootropic, antimanic and antidepressant. Furthermore, the screening
CC      method used in MPHTS will be automated, such that a large number of test
CC      compounds may be rapidly screened with a minimal amount of labour and
CC      effort. This polynucleotide is a human cDNA sequence of a gene that is
CC      differentially expressed in the presence of a therapeutic compound and
CC      represents an exemplary efficacy gene for bipolar affective disorder,
CC      given in an exemplification of the invention.

PS      Claim 1; SEQ ID NO 22979; 103pp; English.
XX
CC      The invention relates to isolated polynucleotide (I) and polypeptide (II)
CC      sequences. (I) is useful as hybridisation probes, polymerase chain
CC      reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
CC      and in recombinant production of (II). The polynucleotides are also used
CC      in diagnostics as expressed sequence tags for identifying expressed
CC      genes. (II) is useful in gene therapy techniques to restore normal
CC      activity of (II) or to treat disease states involving (II). (II) is
CC      useful for generating antibodies against it, detecting or quantitating a
CC      polypeptide in tissue, as molecular weight markers and as a food
CC      supplement. (II) and its binding partners are useful in medical imaging
CC      of sites expressing (II). (I) and (II) are useful for treating disorders
CC      involving aberrant protein expression or biological activity. The
CC      polypeptide and polynucleotide sequences have application in
CC      diagnostics, forensics, gene mapping, identification of mutations
CC      responsible for genetic disorders or other traits to assess biodiversity
CC      and to produce other types of data and products dependent on DNA and
CC      amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
CC      coding sequences of the invention. Note: The sequence data for this
CC      patent did not appear in the printed specification, but was obtained in
CC      electronic format directly from WIPO at

PT 830 Primers useful for synthesizing full length cDNA clones and their use

PS Claim 8; SEQ ID NO 2864; 1380pp + Sequence Listing; English.

XX The invention relates to primers for synthesizing full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesizing the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from BPO

830 Primers useful for synthesizing full length cDNA clones and their use
in genetic manipulation.
XX
Claim 8; SEQ ID NO 2866; 1380pp + Sequence Listing; English.
XX
The invention relates to primers for synthesising full length cDNA
clones. 830 cDNA molecules encoding a human protein have been isolated
and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have
been determined. Primers for synthesising the full length cDNA are useful
for clarifying the function of the protein encoded by the cDNA. The full
length clones were obtained by construction of full length enriched cDNA
libraries that were synthesised by the oligo-capping method. The primers
enable the production of the full length cDNA easily without any special
methods. The present sequence is a full length human cDNA of the
invention. Note: The sequence data for this patent did not form part of
the printed specification, but was obtained in CD-ROM format directly
from SFO

New signal transducer and activator of transcription 6 activation
PT promoting purified protein, for diagnosing and treating disease
PT associated with activation/inhibition of transcription factor e.g.
PT diabetes and cancer.
XX
Claim 4; SEQ ID NO 127; 1368pp; English.
XX
The invention relates to a purified protein promoting signal transducer
and activator of transcription 6 activation (STAT6). The protein is
useful for the producing an antibody, which involves administering the
protein or its epitope-bearing fragments to a non-human animal as an
antigen. The nucleic acid is useful for diagnosing a disease or
susceptibility to a disease related to expression or activity of the
protein. A transformant expressing the protein is useful for screening
compounds which inhibit or promote STAT6 activation. A transformant
expressing the protein is useful for producing a pharmaceutical
composition. Compositions, antibodies and antisense molecules are useful
for the treating a disease associated with STAT6 activation such as
allergic diseases, inflammation, autoimmune diseases, diabetes,
hyperlipidaemia, infections disease and cancers. Compositions are useful
for treating disease associated with STAT6 activation and/or prevention
of Th1 hyperactive diseases. Compositions are also useful in rheumatoid
arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,
allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,
viral hepatitis and AIDS. The protein has efficient promoting STAT6
activity. The protein or nucleic acid is effectively useful for screening
compounds for treating and preventing disease associated with excessive
activation or inhibition of STAT6. The present sequence represents a
human cDNA encoding a protein which promotes STAT6 activation.

XX
XX      This invention relates to a novel primers useful for synthesizing full
CC      length cDNA molecules that encode human proteins. Specifically, it refers
CC      to secretory or membrane proteins that are potential therapeutic agents/
CC      target molecules in the field of medicine, and in particular genes
CC      encoding proteins that are associated with signal transduction,
CC      glycoproteins and transcription. The present invention describes a method
CC      for efficiently cloning a full length human cDNA from both the 5' and 3'
CC      ends using the oligo-capping method. This polynucleotide sequence is a
CC      full length human cDNA clone of the invention.

XX
XX Genomic sequence of Photorhabdus luminescens and encoded polypeptides,
XX useful e.g. as therapeutic antimicrobials and agricultural pesticides.
XX
XX Claim 2; SEQ ID NO 7750; 1205pp; French.
XX
XX The invention relates to the isolation of genes and their encoded
XX proteins from Photorhabdus luminescens. The isolated sequences are
XX sources of probes and primers for detecting the genome of P. luminescens
XX and related species; to study polymorphisms; for gene analysis and for
XX detection/amplification of the genes. Antibodies (Ab) raised against the
XX polypeptides encoded by the genes are used for detection/identification
XX of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that
XX carry a gene-containing vector are used to select compounds that
XX modulate, regulate, induce or inhibit expression of the genes in plants,
XX animals or microorganisms other than P. luminescens and are able to alter
XX response or sensitivity to toxins and antibiotics produced by P.
XX luminescens. Cells transformed to express the genes are useful for
XX recombinant production of the proteins, particularly toxins and
XX antibacterials useful as insecticides, bactericides and fungicides. The

CC genes, proteins, vectors containing the genes and Ab are also useful
CC therapeutically (to treat microbial infection by bacteria or fungi that
CC are sensitive to P. luminescens-encoded toxins or antibiotics) and as
CC biopesticides. Other uses of the genes and the proteins are as virulence
CC factors and for identifying targets of human diseases for which P.
CC luminescens is a model (particularly plague and whooping cough). This
CC sequence represents one of the isolated P. luminescens genes

 XX Nucleic acid array useful for detecting cancer associated nucleic acid,
 PT comprises two or more nucleic acid probes.
 XX Disclosure; SEQ ID NO 70; 198pp; English.
 XX The invention relates to a nucleic acid array for detecting a cancer
 CC associated (CA) nucleic acid, comprising two or more nucleic acid probes.
 CC The invention also relates to a peptide array comprising two or more
 CC isolated polypeptides encoded by a CA nucleic acid sequence, a compound
 CC that binds to a polypeptide, an isolated antibody or its fragment which
 CC binds to a polypeptide, which is prepared by immunizing a host animal
 CC with a composition comprising the polypeptide or its antigen binding
 CC fragment and collecting cells from the host expressing antibodies against
 CC the antigen or its antigen binding fragment, a composition comprising the
 CC antibody and a carrier, a method of screening for anticancer activity, a
 CC method of detecting a CA nucleic acid, a method of diagnosing cancer, a
 CC method of treating cancer and a method of inhibiting expression of a CA
 CC nucleic acid in a cell. The CA nucleic acids are useful for detecting CA
 CC nucleic acids. The antibody is useful for detecting the presence or
 CC absence of cancer cells in an individual which involves contacting cells
 CC from the individual with the antibody and detecting a complex of a CA
 CC protein from the cancer cells and the antibody, where the detection of
 CC the complex correlates with the presence of cancer cells in the
 CC individual. The composition is useful for inhibiting growth of cancer
 CC cells in an individual or for delivering a therapeutic agent to cancer
 CC cells in an individual. The invention is also useful for diagnosing
 CC cancer, for treating cancer and for inhibiting expression of a CA gene in
 CC a cell. This sequence represents human cancer-associated genomic DNA of
 CC the invention.

 XX New recombinant DNA construct, useful for improving plant tolerance to
 PT cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or
 PT pests, for conferring increased resistance to plant disease, or for
 PT improving yield.
 XX Claim 1; SEQ ID NO 20483; 15pp; English.
 PS The invention describes a recombinant DNA construct comprising a
 CC polynucleotide consisting of a sequence encoding an amino acid sequence
 CC available in electronic form from the US patent office at
 CC ftp.segdata.uspto.gov/sequence.html?DocID:2004034888. The polynucleotide
 CC of the invention are also useful in physical arrays of molecules and as
 CC plant breeding markers. The recombinant DNA construct is useful for
 CC improving plant tolerance to cold, heat, drought, herbicides, extreme
 CC osmotic conditions, pathogens or pests, for manipulating growth rate in
 CC plant cells by modification of the cell cycle pathway, for conferring
 CC increased resistance to plant disease, for producing galactomannan,
 CC lignin or plant growth regulators, for increasing the rate of homologous
 CC recombination in plants, for improving yield by modification of
 CC photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake
 CC or by providing improved plant growth and development under at least one
 CC stress condition or for modifying seed oil or protein yield and/or
 CC content. This sequence represents a plant full length insert
 CC polynucleotide that can be used in the recombinant DNA construct of the
 CC invention.

 CC in conjunction with treatment for diabetes, high blood pressure and high
 CC cholesterol.
 CC
 PS Claim 28; Page 98-99; 171pp; English.
 XX
 CC The present sequence encodes a leptin receptor (OB-R) protein, OB-Rb. The
 CC OB-R can be used to treat obesity, optionally in conjunction with a
 CC treatment for diabetes, high blood pressure and high cholesterol, or in
 CC cosmetic compositions for reducing body weight. It may also be used in
 CC agriculture to produce leaner food animals, e.g. beef cattle, swine
 CC poultry, sheep. An antibody specific for OB-R can be used to measure the
 CC presence of OB-R in a sample, optionally in vivo, while the nucleic acid
 CC molecule encoding OB-R can be used to detect defects in the OB-R
 CC polypeptide associated with obese phenotypes, or diagnostically to
 CC measure its encoded RNA and protein in nutritional disorders. The nucleic
 CC acid molecule can be used in gene therapy, or the antisense nucleic acid
 CC molecule can be used to antagonise leptin activity. The nucleic acid
 CC molecule, or the antisense nucleic acid molecule, can be used to treat
 CC weight loss e.g. associated with AIDS, cancer or anorexia nervosa

 DR
 XX New recombinant nucleic acid encoding carcinoma associated protein,
 PT

PT useful for preparing compositions for treating carcinomas.

PS Claim 1; SEQ ID NO 980; 245pp; English.

XX The invention relates to recombinant carcinoma associated (CA) nucleic acid sequences from mouse and human (ADA01482-ADA03094), and to recombinant carcinoma associated proteins (CAP) encoded by them. The invention also encompasses expression vectors and host cells comprising a CA nucleic acid, a polypeptide (especially an antibody) that specifically binds to the protein, and a biochip comprising CA nucleic acid or fragments thereof. The sequences of the invention were identified using oncogenic retroviruses, which insert into the genome of the host organism at random. Many of these do not carry transduced host oncogenes or pathogenic trans-acting viral genes, meaning that cancer incidence is a direct consequence of the effects of proviral integration into host protooncogenes. The CA nucleic acid sequences can be used to diagnose carcinoma (especially breast cancer, prostate cancer, lymphoma or leukaemia) or a propensity to carcinoma by determination of the sequence of a CA gene, or by determination of CA gene expression in particular tissues. CA nucleic acids, proteins and antibodies are also useful as therapeutic agents and in screening and evaluating drug candidates. The present sequence represents a specifically claimed human CA nucleic acid sequence of the invention. Note: The complete sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

PT Disclosure; SEQ ID NO 495; 182pp; English.

PS
 XX The invention relates to cancer-associated proteins (CAP) and the cancer-
 CC associated (CA) nucleic acids encoding them. The invention also relates
 CC to a method for treating cancers involving administering to a patient an
 CC inhibitor of CAP, and a method of screening for anticancer activity in a
 CC potential drug involving providing a cell that expresses a CA gene,
 CC contacting a tissue sample derived from a cancer cell with an anticancer
 CC drug candidate and monitoring the effect of the anticancer drug candidate
 CC on expression of the CA gene. The CAP proteins are useful for detecting
 CC cancer associated with expression of a CAP protein in a test cell sample
 CC and for screening for a bioactive agent capable of modulating the
 CC activity of a CAP protein. The CA nucleic acids are useful for diagnosing
 CC cancer, involving determining the expression of a CA nucleic acid in a
 CC tissue. This sequence represents a murine CA gene of the invention. Note:
 CC The sequence data for this patent did not form part of the printed
 CC specification, but was obtained in electronic format directly from WIPO
 CC at ftp.wipo.int/pub/published_pct_sequences

 XX altered gene expression, to recover regulatory elements and to follow
 XX inheritance of desirable characteristics through hybrid breeding
 XX programs.

XX Claim 1; SEQ ID NO 4788; 201pp; English.

XX The present sequence describes a purified corn tassell-derived
 CC polynucleotide sequence (cdps) comprising a nucleic acid sequence
 CC selected from those given in ABL70627 to ABL76833. The cdps sequences
 CC encode corn tassell-derived polypeptides (CDPs). The cdps sequences (I)
 CC can be used for determining altered gene expression, to recover
 CC regulatory elements and to follow inheritance of desirable
 CC characteristics through hybrid breeding programs. (I) are also useful in
 CC the evaluation, and alteration of desired characteristics associated with
 CC growth and development, disease resistance, environmental adaptability,
 CC quality and yield, and as molecular markers for studying inheritance of
 CC multigene traits in a plant breeding program. (I) can be used to produce
 CC a tassell-specific profile of gene transcription, a transcript image, to
 CC clone regulatory elements for use in transformation vectors, to express a
 CC polypeptide, to identify, isolate or extend identical or related corn
 CC tassell nucleic acid sequences from DNA libraries, in nucleic acid
 CC hybridisation or amplification technologies, as query sequences to
 CC determine homology of known sequences, as probe for use in Southern or
 CC Northern hybridisation, and to identify the presence of and/or to
 CC determine the degree of similarity between two (or more) nucleic acid
 CC sequences

Sanger Xenopus tropicalis EST/cDNA project.
This sequence is from a Xenopus Gene Collection (XGC) library, from
a library constructed by Aaron M. Zorn. cDNA was prepared from RNA
extracted from gastrula embryos. EcoRI-NotI cut cDNA was then
ligated into pCG107 with EcoRI at the 5' end and NotI at the 3'
end.
Vector: pCG107; Site 1: EcoRI; Site 2: NotI
Host: Escherichia coli XL1-blue.

Clone distribution: MGC clone distribution information can be found
through the I.M.A.G.E. Consortium/LLNL at: <http://image.llnl.gov>
Series: IRAK Plate: 123 Row: p Column: 18

This clone was selected for full length sequencing because it
passed the following selection criteria: matched mRNA gi: 6755854.

The International consortium for macaque cDNA sequencing and
analysis consists of: Department of Virology and Human Genome
Center, Institute of Medical Science, The University of Tokyo,
Tokyo, Japan; Division of Genetic Resources, National Institute of
Infectious Diseases of Japan, Tokyo, Japan; National Health
Research Institute, Taipei, Taiwan; Institute of Molecular Biology,
Academia Sinica, Taipei, Taiwan; Department of Ecology & Evolution,
University of Chicago, Chicago, IL, USA; Center for Information

```

Biology, National Institute of Genetics of Japan, Mishima, Japan.
Clone distribution: clone distribution information can be found at:
<http://www.nih.go.jp/yoken/genebank/>

Lab host: TOP10
Vector: pME18S-FL3 (Acc.No. AB009864)
R. Site1: DraIII (CAGCTGTGTG)
R. Site2: DraIII (CAGCATGTG)
Description: 1st strand cDNA was primed with an oligo(dT) primer
[ATGTGGCTTTTCTTTTCTTTT]; double-stranded cDNA was synthesized
using specific 5' and 3' primers and amplified by PCR. The PCR
product was digested with SfiI and size selection was performed to
exclude fragments <1.5kb. The SfiI-digested PCR product was cloned
into distinct DraIII sites of pME18S-FL3. XhoI sites just outside
the DraIII sites can be used to isolate the cDNA insert. Libraries
were constructed by oligo-capping method. Libraries were made from:

Qccs: cerebellum cortex
QnpA: parietal lobe
QnpB: temporal lobe right
Qf1A: frontal lobe left
QmoA: medulla oblongata
QbsA: brain stem
QbsB: occipital lobe right
QtsA: testis

Custom primers were used for 5' and 3'-end sequencing. The
full-insert sequencing was done by primer-walking method using ABI
DNA sequencer.

----- Summary Statistics

Drafting center: WIBR

NOTICE:

This sequence was finished as follows unless otherwise noted:
all regions were double stranded, sequenced with an alternate
chemistry, or covered by high quality data (i.e. phred quality
>30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone, fosmid clone or direct clone walk sequence.
Sequence from the Mouse Genome Sequencing Consortium whole genome
shotgun may have been used to obtain the consensus sequence. The
assembly was confirmed by restriction digest.
This finishing standard has slightly changed from the previous
Human standard. Specifically, standards for regions of low sequence
complexity (such as dinucleotide repeats and small unit tandem
repeats) have been relaxed. These regions are very prevalent in the
mouse genome, and the return on extended finishing efforts is
minimal.
If a sequence meets the criteria of the above statement, it needs
no comments or tags. If the criteria are not met, such as ambiguous
bases, then the region is duly annotated.

MAPPING INFORMATION:
Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see <http://genome.wustl.edu>

SOURCE INFORMATION:
The BAC Library has been constructed by Pieter de Jong and coworkers (<http://www.chori.org>) from male C57BL/6J mouse spleen and/or brain genomic DNA. The clone and detailed information can be obtained from Pieter de Jong and coworkers at <http://www.chori.org>

This sequence is the entire insert of the clone.

Direct Submission
Submitted (19-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

Center clone name: CH230-176H20
----- Summary Statistics
Assembly program: Phrap; version 0.990329
Consensus quality: 201781 bases at least Q40
Consensus quality: 203921 bases at least Q30

Consensus quality: 205310 bases at least Q20
 Estimated insert size: 205531; sum-of-contigs estimation
 Quality coverage: 7x in Q20 bases; sum-of-contigs estimation

- * NOTE: Estimated insert size may differ from sequence length
 (see http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html).
- * NOTE: This is a 'working draft' sequence. It currently
 consists of 1 contigs. Gaps between the contigs
 are represented as runs of N. The order of the pieces
 is believed to be correct as given, however the sizes
 of the gaps between them are based on estimates that have
 been provided by the submitter.
- * This sequence will be replaced
 by the finished sequence as soon as it is available and
 the accession number will be preserved.
- * 1 210237: contig of 210237 bp in length.

-----
RP11-328C23 is from the library RPCI-11.2 constructed by the group
of Pieter de Jong. For further details see
http://www.chori.org/bacpac/home.htm
VECTOR: pBACe3.6
This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e. phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one subclone; and the assembly was confirmed by restriction digest,
except on the rare occasion of the clone being a YAC.

----- Project Information

Center project name: L21976

Center clone name: 350_I_3

* NOTE: This record contains 84 individual
 * sequencing reads that have not been assembled into
 * contigs. Runs of N are used to separate the reads
 * and the order in which they appear is completely
 * arbitrary. Low-pass sequence sampling is useful for
 * identifying clones that may be gene-rich and allows
 * overlap relationships among clones to be deduced.
 * However, it should not be assumed that this clone
 * will be sequenced to completion. In the event that
 * the record is updated, the accession number will
 * be preserved.

* 1 656: contig of 656 bp in length

* 657 756: gap of 100 bp

* 757 1433: contig of 677 bp in length

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX The invention describes a method comprising comparing an expression
 CC profile of at least one gene in a peripheral blood sample of a patient to
 CC at least one reference expression profile of the at least one gene, where
 CC the patient has a solid tumour, and each of the gene is differentially
 CC expressed in peripheral blood mononuclear cells (PBMCs) of a first class
 CC of patients as compared to PBMCs of a second class of patients, where
 CC both the first and second classes of patients have the solid tumour, and
 CC each of the first and second classes is a subcluster formed by an
 CC unsupervised clustering analysis of gene expression profiles in PBMCs of
 CC a population of patients who have the solid tumour, and where the
 CC majority of the first class of patients has a first clinical outcome, and
 CC the majority of the second class of patients has a second clinical
 CC outcome. Also described are: a system comprising (i) a memory or a
 CC storage medium including data that represent an expression profile of at
 CC least one gene in a peripheral blood sample of a patient who has a solid
 CC tumour, (ii) at least another storage medium including data that
 CC represent at least one reference expression profile of the gene, (iii) a
 CC program capable of comparing the expression profile to the reference
 CC expression profile, and (iv) a processor capable of executing the
 CC program, where expression levels of the gene in peripheral blood
 CC mononuclear cells of patients who have the solid tumour correlate with
 CC clinical outcomes of the patients; and a nucleic acid or protein array
 CC comprising concentrated probes for solid tumour prognosis genes, where
 CC each of the solid tumour prognosis genes is differentially expressed in
 CC PBMCs of a first class of patients as compared to PBMCs of a second class
 CC of patients, where both the first and second classes of patients have a
 CC solid tumour, and where the first class of patients has a first clinical
 CC outcome, and the second class of patients has a second clinical outcome.
 CC The method, system, and array are useful for prognosing and treating
 CC solid tumours. This sequence represents a solid tumour prognosis gene of
 CC the invention. Note: The sequence data for this patent did not form part
 CC of the printed specification, but was obtained in electronic format
 CC directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

 Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
 response useful in vaccinating against and in treating tumors.

XX Disclosure; Page 78-79; 79pp; English.
XX
XX The present sequence encodes the canine 574 tumour-associated antigen
CC (TAA). The TAA 574 is a glycoprotein which is widely expressed in
CC carcinomas but has a highly restricted expression pattern in normal adult
CC tissues. It appears to be strongly correlated to metastasis in colorectal
CC and gastric cancer. 574 antigen may therefore be useful in tumour
CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
CC induced were inoculated with a virus expression vector containing the
CC human or murine 574 gene sequence. The 574 antigen was shown to be
CC effective at eliciting an immunotherapeutic anti-tumour response. Both
CC the nucleic acid encoding the antigen and the antigen itself can be used
CC to elicit an immune response, preferably CTL or an antibody response in a
CC subject

XX Detecting a breast cancer-associated transcript in a patient's cell,
PT useful for diagnosing breast cancer, comprises contacting a biological
PT sample with a polynucleotide that selectively hybridizes with breast
PT cancer nucleic acids.

XX Claim 9; Page 372; 414pp; English.

XX The invention comprises a method of detecting a breast cancer-associated
CC transcript in a cell from a patient. The method of the invention involves
CC contacting a biological sample from the patient with a nucleotide that
CC hybridises to one of the 69 breast cancer-associated gene sequences shown
CC in the specification. The method of the invention is useful in the
CC diagnosis or prognosis of breast cancer, and for detecting genes that are
CC up or down-regulated in breast cancer cells. Genes identified by the
CC method of the invention can be used in diagnostic purposes and also as
CC targets for screening for therapeutic compounds that modulate breast
CC cancer (e.g. hormones or antibodies). Identification of genes that are
CC over or under expressed in breast cancer can additionally provide high-
CC resolution, high-sensitivity datasets which can be used in the areas of
CC diagnostics, therapeutics, drug development, pharmacogenetics, protein
CC structure and biosensor development. DNA sequences ABT07693 - ABT07761
CC represent the 69 breast cancer-associated gene sequences of the invention

XX Detecting a lung cancer-associated transcript in a cell from a patient
PT for treating lung cancer, by contacting a biological sample from the

PT patient with a polynucleotide that exhibits increased or decreased
 PT expression in lung cancer.
 XX
 XX Claim 22; Page 336; 453pp; English.
 XX
 CC The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridizes
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

XX Detecting an ovarian cancer-associated transcript in a cell from a
 PT patient, comprises contacting a biological sample from the patient with a
 PT polynucleotide that hybridizes to an ovarian cancer gene.

XX Claim 10; Page 297; 332pp; English.

XX The invention relates to a method of detecting an ovarian cancer-
 CC associated transcript in a cell from a patient, by contacting a
 CC biological sample from the patient with a polynucleotide that selectively
 CC hybridizes to a sequence at least 80% identical to any of one of 80
 CC nucleic acid sequences given in the specification. The method is useful
 CC in diagnosing ovarian cancer and in identifying and using agents and/or
 CC targets that inhibit ovarian cancer. The nucleic acid molecule,
 CC polypeptide and the antibody may also be used in detecting ovarian
 CC cancers, monitoring and early detection of relapse following treatment,
 CC monitoring response to therapy, selecting patients for post-operative
 CC chemotherapy or radiation therapy, in selecting mode of therapy,
 CC determining tumour prognosis, early detection of pre-cancerous lesions,
 CC and as vaccines. This sequence corresponds to one of the nucleic acids
 CC used for the detection method of the invention.

XX Determining the presence or absence of a pathological cell in a patient,
PT useful for diagnosing, prognosing or treating cancer, comprises detecting
PT a nucleic acid in a biological sample.
XX
XX Claim 8; SEQ ID NO 41; 1385pp; English.
XX
XX The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
CC whose expression is upregulated or downregulated in specific cancers or
CC other diseases such as angiogenic or fibrotic disorders, and to methods
CC of determining the presence or absence of a pathological cell in a
CC patient by detecting a nucleic acid at least 80% identical to those of
CC the invention or by detecting a polypeptide of the invention. The
CC invention also relates to expression vectors and host cells comprising a
CC nucleic acid of the invention; antibodies which specifically bind a
CC polypeptide of the invention; use of such antibodies for drug targeting;
CC and methods of screening for modulators of activity or expression of the
CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
CC antibodies and methods are useful for diagnosing, prognosing and treating
CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
CC neovascularization syndromes, scarring and uterine fibroids. They may
CC also be useful in wound healing and in contraception. The present
CC sequence represents a nucleic acid sequence of the invention.

XX New NOVX polypeptides and polynucleotides, useful for preventing,
PT diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer,
PT Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic
PT disorders, and asthma.
XX
XX Claim 16; Page 114-115; 619pp; English.
XX
XX The present invention relates to new isolated proteins (NOVX) and their
CC coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is
CC any number from 1 to 48. The NOVX proteins and coding sequences are
CC useful in the manufacture of a medicament for treating a syndrome
CC associated with a human disease, preferably a NOVX-associated disorder.
CC The NOVX coding sequences and proteins are useful for treating,
CC preventing or diagnosing diseases such as metabolic disorders, diabetes,
CC obesity, infectious disease, anorexia, cancer-associated cachexia,
CC cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's
CC disease, immune disorders, hematopoietic disorders, cardiovascular
CC disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic
CC disturbances associated with obesity, metabolic syndrome X or wasting
CC disorders associated with chronic diseases or various cancers. The NOVX
CC coding sequences and proteins may also be used as targets for the
CC identification of small molecules that modulate or inhibit e.g.
CC neurogenesis, cell differentiation, cell proliferation, haematopoiesis,
CC wound healing and angiogenesis, in gene therapy, in generation of
CC antibodies that bind immunospecifically to NOVX substances for use in
CC therapeutic or diagnostic methods

XX Novel canine or feline 5T4 polypeptide and polynucleotides encoding the
XX polypeptide, useful in preparation of vaccine for treating and/or
XX preventing cancer in a subject, preferably a dog or cat.
XX Claim 4; Page 68; 68pp; English.
XX The present invention relates to the isolation of canine and feline
XX oncofoetal leucine-rich glycoproteins known as 5T4, and the
XX polynucleotide sequences encoding them. The 5T4 proteins are expressed in
XX a significant proportion of tumours. The sequences of the invention are
XX useful in a pharmaceutical composition for the prevention and/or
XX treatment of tumours or other diseases associated with cell
XX proliferation, infections, and inflammatory conditions in animals,
XX preferably dogs or cats. The compositions may also be used for cancer
XX immunotherapy in these animals. The sequences of the invention may also
XX be used in diagnostic kits for rapid, reliable, sensitive, and specific
XX measurement and localisation of 5T4 in extracts of plasma, urine,
XX tissues, and in cell culture media. Antibodies specific for the 5T4
XX protein are useful for isolating foetal cells from maternal blood. The
XX isolation process may form part of a diagnostic method e.g. the foetal
XX cells may then be subject to biochemical or genetic sampling used for
XX testing foetal abnormalities, or to determine the sex of the foetus(es).
XX The present sequence encodes feline 5T4 protein

New major histocompatibility complex class I peptide epitopes from human
5T4 tumor-associated antigen, useful for preventing and/or treating a
disease, particularly cancer.
Disclosure; Page 67; 73pp; English.
The invention relates to a novel Major Histocompatibility Complex (MHC)
class I peptide epitope of the 5T4 antigen. The invention further
provides a polypeptide string comprising the 5T4 epitope; a nucleic acid
sequence encoding the 5T4 epitope or a polypeptide string of the 5T4
epitope; a vector system capable of delivering the 5T4 epitope nucleic
acid to a cell; a cell pulsed with the 5T4 epitope, a polypeptide of the
5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine
comprising the above, a method for treating and/or preventing a disease
in a subject by administering the vaccine; an agent capable of binding
specifically to the 5T4 epitope and/its encoding nucleic acid; a method
comprising detecting the presence of the 5T4 epitope or its encoding
nucleic acid in a subject; and a T cell line or clone capable of
specifically recognising the 5T4 epitope in conjunction with an MHC class
I molecule. The 5T4 epitope has cytostatic activity. The vaccine
comprising the 5T4 epitope or its encoding nucleic acid and the vector
system or cell is useful in the prevention and/or treatment of a disease,
particularly cancer. The detection method is useful for diagnosing or
monitoring the progression of a cancerous disease, and for detecting the
presence of the 5T4 epitope or its nucleic acid. The T cell line or clone
is useful in the manufacture of a medicament for treating and/or
preventing a disease. This polynucleotide sequence represents the feline
5T4 antigen coding DNA of the invention.

XX XX
XX PT Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
XX PT response useful in vaccinating against and in treating tumors.
XX PS Example 2; Page 78; 79pp; English.
XX CC The present sequence encodes the human 5T4 tumour-associated antigen
XX CC (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
XX CC carcinomas but has a highly restricted expression pattern in normal adult
XX CC tissues. It appears to be strongly correlated to metastasis in colorectal
XX CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
XX CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
XX CC induced were inoculated with a virus expression vector containing the
XX CC present sequence. The 5T4 antigen was shown to be effective at eliciting
XX CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
XX CC the antigen and the antigen itself can be used to elicit an immune
XX CC response, preferably CTL or an antibody response in a subject

 DR New genes regulated by MYCN activation, useful in gene therapy,
 PT particularly for treating a subject with e.g. neuroblastoma or other
 PT cancers, or for diagnosing, staging or monitoring the treatment of the
 PT cancer.
 XX
 XX Claim 1; SEQ ID NO 105; 27pp; English.
 XX
 PS This invention relates to novel isolated cDNAs that are differentially
 CC expressed in MYCN activated cells. Specifically, it refers to
 CC polynucleotide sequences that exhibit differential expression patterns in
 CC cells activated by the transactivator MYCN, where MYCN is a proto-
 CC oncogene that is amplified in neuroblastoma cells and is common in small
 CC cell lung cancers. The present invention describes these cDNA molecules
 CC as useful for in hybridisation assays to detect expression of nucleic
 CC acids (or complementary nucleic acids) in a present in a given sample, as
 CC well as for screening assays by identifying molecules or compounds that
 CC specifically bind the cDNA as a ligand and modulate function or activity.
 CC Accordingly, these compositions exhibit cytostatic activity and can also
 CC be used for gene therapy purposes. This polynucleotide sequence is a cDNA
 CC that is differentially expressed in MYCN activated cells, given in an
 CC exemplification of the invention. NOTE: This sequence does not appear in
 CC the printed specification but has been obtained in electronic format from
 CC the US Patent Office at
 CC ftp.seqdata.uspto.gov/sequence.html?DocID=20030119009.

 DR
 XX Detecting a bladder cancer-associated transcript in a cell from a
 PT patient, comprises contacting a biological sample from the patient with a
 PT bladder cancer-associated polynucleotide or antibody.
 XX
 XX Claim 6; Page 296; 307pp; English.
 XX
 PS The present invention describes a method for detecting a bladder cancer-
 CC associated transcript in a cell from a patient. The method comprises
 CC contacting a biological sample from the patient with a polynucleotide
 CC that selectively hybridises to a sequence that is 80 % identical to a
 CC table of sequences (see ACC50951 to ACC51059). ACC50951 to ACC51059
 CC encode the human bladder cancer-associated proteins given in ABR48146 to
 CC ABR48242). Bladder cancer-associated sequences from the present invention
 CC have cytostatic activities, and can be used in antisense gene therapy and
 CC in vaccine production. The method can be used for detecting a bladder
 CC cancer-associated transcript in a cell from a patient. The method is
 CC useful in diagnosing or treating bladder cancer and in screening for
 CC compounds that modulate bladder cancer, such as hormones or antibodies.
 CC The nucleic acid molecules from the present invention may be used in
 CC various screening and diagnostic methods, and for gene therapy, vaccine
 CC and/or antisense/inhibition applications

 XX
 XX Detecting a lung cancer-associated transcript in a cell from a patient
 PT for treating lung cancer, by contacting a biological sample from the
 PT patient with a polynucleotide that exhibits increased or decreased
 PT expression in lung cancer.
 XX
 XX Claim 22; Page 335; 453pp; English.
 PS
 XX The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridises
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

XX Determining the presence or absence of a pathological cell in a patient,
XX useful for diagnosing, prognosing or treating cancer, comprises detecting
XX a nucleic acid in a biological sample.
XX
XX Claim 8; SEQ ID NO 39; 1385pp; English.
XX
XX The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
XX whose expression is upregulated or downregulated in specific cancers or
XX other diseases such as angiogenic or fibrotic disorders, and to methods
XX of determining the presence or absence of a pathological cell in a
XX patient by detecting a nucleic acid at least 80% identical to those of
XX the invention or by detecting a polypeptide of the invention. The
XX invention also relates to expression vectors and host cells comprising a
XX nucleic acid of the invention; antibodies which specifically bind a
XX polypeptide of the invention; use of such antibodies for drug targeting;
XX and methods of screening for modulators of activity or expression of the
XX polypeptides and nucleic acids. The nucleic acids, polypeptides,
XX antibodies and methods are useful for diagnosing, prognosing and treating
XX cancer and other conditions such as psoriasis, ischaemia, heart disease,
XX atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
XX neovascularisation syndromes, scarring and uterine fibroids. They may
XX also be useful in wound healing and in contraception. The present
XX sequence represents a nucleic acid sequence of the invention.

 PS Claim 1; SEQ ID NO 53; 319pp; English.
 XX
 CC The present invention relates to the isolation of human tumour-associated
 CC antigenic target (TAT) polynucleotide and polypeptide sequences. Also
 CC disclosed is an antibody that binds to a TAT polypeptide. The antibody is
 CC a monoclonal antibody, an antibody fragment, a chimeric antibody or a
 CC humanised antibody. It is conjugated to a growth inhibitory agent. It is
 CC produced in bacteria or in CHO cells and induces death of a cell to which
 CC it binds. The antibody is useful for preparing a composition for
 CC diagnosing or treating tumours and cancer. The present sequence
 CC represents a human TAT cDNA sequence of the invention.

CC The invention relates to human tumour-associated antigenic target (TAT)
CC polypeptides, and their related nucleic acids. The TAT polypeptides are
CC overexpressed in cancer tissues compared to normal tissues, and may thus
CC serve as effective targets for the diagnosis and treatment of cancer in
CC mammals. The invention also relates to nucleic acid and polypeptide
CC sequences at least 80% identical to the TAT nucleic acids and
CC polypeptides; expression vectors and host cells comprising a TAT nucleic
CC acid; an antibody specific for a TAT polypeptide; a peptide or organic
CC molecule which binds to a TAT polypeptide; fusion proteins comprising a
CC TAT polypeptide; and methods and compositions for the treatment or
CC diagnosis of cancer in mammals. TAT polypeptides, nucleic acids,
CC antibodies, antagonists, binding molecules and compositions are useful
CC for diagnosing or treating a cell proliferative disorder associated with
CC increased TAT expression, particularly cancers such as breast cancer,
CC colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder
CC cancer, pancreatic cancer, cervical cancer, cancers of the central
CC nervous system, melanoma and leukaemia. TAT nucleic acids may further be
CC used as hybridisation probes, in chromosome and gene mapping, in
CC chromosome identification and in gene therapy. The present sequence
XX represents a TAT nucleic acid of the invention

 PT 830 Primers useful for synthesizing full length cDNA clones and their use
 PT in genetic manipulation.
 XX Claim 8; SEQ ID NO 2864; 1380pp + Sequence Listing; English.
 CC The invention relates to primers for synthesizing full length cDNA
 CC clones. 830 cDNA molecules encoding a human protein have been isolated
 CC and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have
 CC been determined. Primers for synthesizing the full length cDNA are useful
 CC for clarifying the function of the protein encoded by the cDNA. The full
 CC length clones were obtained by construction of full length enriched cDNA
 CC libraries that were synthesised by the oligo-capping method. The primers
 CC enable the production of the full length cDNA easily without any special
 CC methods. The present sequence is a full length human cDNA of the
 CC invention. Note: The sequence data for this patent did not form part of
 CC the printed specification, but was obtained in CD-ROM format directly
 CC from EPO

XX XX New signal transducer and activator of transcription 6 activation

PT promoting purified protein, for diagnosing and treating disease

PT associated with activation/inhibition of transcription factor e.g.

PT diabetes and cancer.

XX PS Claim 4; SEQ ID NO 127; 1368pp; English.

XX CC The invention relates to a purified protein promoting signal transducer

CC and activator of transcription 6 activation (STAT6). The protein is

CC useful for the producing an antibody, which involves administering the
 CC protein or its epitope-bearing fragments to a non-human animal as an
 CC antigen. The nucleic acid is useful for diagnosing a disease or
 CC susceptibility to a disease related to expression or activity of the
 CC protein. A transformant expressing the protein is useful for screening
 CC compounds which inhibit or promote STAT6 activation. A transformant
 CC expressing the protein is useful for producing a pharmaceutical
 CC composition. Compositions, antibodies and antisense molecules are useful
 CC for the treating a disease associated with STAT6 activation such as
 CC allergic diseases, inflammation, autoimmune diseases, diabetes,
 CC hyperlipidaemia, infections disease and cancers. Compositions are useful
 CC for treating disease associated with STAT6 activation and/or prevention
 CC of Th1 hyperactive diseases. Compositions are also useful in rheumatoid
 CC arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,
 CC allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,
 CC viral hepatitis and AIDS. The protein has efficient promoting STAT6
 CC activity. The protein or nucleic acid is effectively useful for screening
 CC compounds for treating and preventing disease associated with excessive
 CC activation or inhibition of STAT6. The present sequence represents a
 CC human cDNA encoding a protein which promotes STAT6 activation.

```

XX  Example 1, SEQ ID NO 2866; 1340pp; English.
XX
XX  This invention relates to a novel primers useful for synthesising full
CC  length cDNA molecules that encode human proteins. Specifically, it refers
CC  to secretory or membrane proteins that are potential therapeutic agents/
CC  target molecules in the field of medicine, and in particular genes
CC  encoding proteins that are associated with signal transduction,
CC  glycoproteins and transcription. The present invention describes a method
CC  for efficiently cloning a full length human cDNA from both the 5' and 3'
CC  ends using the oligo-capping method. This polynucleotide sequence is a
CC  full length human cDNA clone of the invention.

PT

```

```

PS  Claim 4; SEQ ID NO 125; 1368pp; English.
XX
XX  The invention relates to a purified protein promoting signal transducer
CC  and activator of transcription 6 activation (STAT6). The protein is
CC  useful for the producing an antibody, which involves administering the
CC  protein or its epitope-bearing fragments to a non-human animal as an
CC  antigen. The nucleic acid is useful for diagnosing a disease or
CC  susceptibility to a disease related to expression or activity of the
CC  protein. A transformant expressing the protein is useful for screening
CC  compounds which inhibit or promote STAT6 activation. A transformant
CC  expressing the protein is useful for producing a pharmaceutical
CC  composition. Compositions, antibodies and antisense molecules are useful
CC  for the treating a disease associated with STAT6 activation such as
CC  allergic diseases, inflammation, autoimmune diseases, diabetes,
CC  hyperlipidaemia, infections disease and cancers. Compositions are useful
CC  for treating disease associated with STAT6 activation and/or prevention
CC  of Th1 hyperactive diseases. Compositions are also useful in rheumatoid
CC  arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,
CC  allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,
CC  viral hepatitis and AIDS. The protein has efficient promoting STAT6
CC  activity. The protein or nucleic acid is effectively useful for screening
CC  compounds for treating and preventing disease associated with excessive
CC  activation or inhibition of STAT6. The present sequence represents a
CC  human cDNA encoding a protein which promotes STAT6 activation.

XX New antisense nucleic acids, useful for identifying proteins or screening

PT for homologous nucleic acids required for cellular proliferation to

PT isolate candidate molecules for rational drug discovery programs.

XX Claim 14; SEQ ID NO 16351; 1766pp; English.

CC The invention relates to an isolated nucleic acid comprising any one of
 CC the 6213 antisense sequences given in the specification where expression
 CC of the nucleic acid inhibits proliferation of a cell. Also included are:
 CC (1) a vector comprising a promoter operably linked to the nucleic acid
 CC encoding a polypeptide whose expression is inhibited by the antisense
 CC nucleic acid; (2) a host cell containing the vector; (3) an isolated
 CC polypeptide or its fragment whose expression is inhibited by the
 CC antisense nucleic acid; (4) an antibody capable of specifically binding

CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
 CC proliferation or the activity of a gene in an operon required for
 CC proliferation; (7) identifying a compound that influences the activity of
 CC the gene product or that has an activity against a biological pathway
 CC required for proliferation, or that inhibits cellular proliferation; (8)
 CC identifying a gene required for cellular proliferation or the biological
 CC pathway in which a proliferation-required gene or its gene product lies
 CC or a gene on which the test compound that inhibits proliferation of an
 CC organism acts; (9) manufacturing an antibiotic; (10) profiling a
 CC compound's activity; (11) a culture comprising strains in which the gene
 CC product is overexpressed or underexpressed; (12) determining the extent
 CC to which each of the strains is present in a culture or collection of
 CC strains; or (13) identifying the target of a compound that inhibits the
 CC proliferation of an organism. The antisense nucleic acids are useful for
 CC identifying proteins or screening for homologous nucleic acids required
 CC for cellular proliferation to isolate candidate molecules for rational
 CC drug discovery programs, or for screening homologous nucleic acids
 CC required for proliferation in cells other than *S. aureus*, *S. typhimurium*,
 CC *K. pneumoniae* or *P. aeruginosa*. The present sequence is one of the target
 CC prokaryotic essential genes. Note: The sequence data for this patent did
 CC not form part of the printed specification, but was obtained in
 CC electronic format directly from WIPO at

 PT New isolated polynucleotide and encoded polypeptides, useful in
 PT diagnostics, forensics, gene mapping, identification of mutations
 PT responsible for genetic disorders or other traits and to assess
 PT biodiversity.
 XX
 PS Claim 1; SEQ ID NO 22978; 103pp; English.
 XX
 CC The invention relates to isolated polynucleotide (I) and polypeptide (II)
 CC sequences. (I) is useful as hybridisation probes, polymerase chain
 CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
 CC and in recombinant production of (II). The polynucleotides are also used
 CC in diagnostics as expressed sequence tags for identifying expressed
 CC genes. (II) is useful in gene therapy techniques to restore normal
 CC activity of (II) or to treat disease states involving (II). (II) is
 CC useful for generating antibodies against it, detecting or quantitating a
 CC polypeptide in tissue, as molecular weight markers and as a food
 CC supplement. (II) and its binding partners are useful in medical imaging
 CC of sites expressing (II). (I) and (II) are useful for treating disorders
 CC involving aberrant protein expression or biological activity. The
 CC polypeptide and polynucleotide sequences have application in
 CC diagnostics, forensics, gene mapping, identification of mutations
 CC and to produce other types of data and products dependent on DNA and
 CC amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
 CC coding sequences of the invention. Note: The sequence data for this
 CC patent did not appear in the printed specification, but was obtained in
 CC electronic format directly from WIPO at
 CC ftp.wipo.int/pub/published_pct_sequences

 PT Genomic sequence of Photorhabdus luminescens and encoded polypeptides,
 PT useful e.g. as therapeutic antimicrobials and agricultural pesticides.
 XX
 CC Claim 2; SEQ ID NO 10464; 1205pp; French.
 XX
 CC The invention relates to the isolation of genes and their encoded
 CC proteins from Photorhabdus luminescens. The isolated sequences are
 CC sources of probes and primers for detecting the genome of P. luminescens
 CC and related species; to study polymorphisms; for gene analysis and for
 CC detection/amplification of the genes. Antibodies (Ab) raised against the
 CC polypeptides encoded by the genes are used for detection/identification
 CC of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that
 CC carry a gene-containing vector are used to select compounds that
 CC modulate, regulate, induce or inhibit expression of the genes in plants,
 CC animals or microorganisms other than P. luminescens and are able to alter
 CC response or sensitivity to toxins and antibiotics produced by P.
 CC luminescens. Cells transformed to express the genes are useful for
 CC recombinant production of the proteins, particularly toxins and
 CC antibacterials useful as insecticides, bactericides and fungicides. The
 CC genes, proteins, vectors containing the genes and Ab are also useful
 CC therapeutically (to treat microbial infection by bacteria or fungi that
 CC are sensitive to P. luminescens-encoded toxins or antibiotics) and as
 CC biopesticides. Other uses of the genes and the proteins are as virulence
 CC factors and for identifying targets of human diseases for which P.
 CC luminescens is a model (particularly plague and whooping cough). This
 CC sequence represents one of the isolated P. luminescens genes

 XX New Proteus mirabilis polypeptides and polynucleotides, useful as
 PT reagents for diagnosis of bacterial disease, as components of
 PT antibacterial vaccines, as targets for antibacterial drugs, or as
 PT biocontrol agents for plants.
 XX
 XX Disclosure; SEQ ID NO 3474; 870pp; English.
 XX
 CC The invention relates to new Proteus mirabilis polypeptides and
 CC polynucleotides. The invention also relates to antibodies against the
 CC polypeptides, methods for producing the polypeptides, a method of
 CC generating vaccines for immunising an individual against P. mirabilis, a
 CC method for evaluating a compound for the ability to bind a P. mirabilis
 CC polypeptide and a method for screening test compounds for anti-bacterial
 CC activity. The polypeptides and polynucleotides are useful as molecular
 CC targets for diagnosing, preventing and treating pathological conditions
 CC resulting from bacterial infection, as reagents for diagnosis of
 CC bacterial diseases, as components of antibacterial vaccines, as targets
 CC for antibacterial drugs or as bio-control agents for plants. This
 CC sequence represents a Proteus mirabilis polynucleotide of the invention.

 PT New fusion protein comprising an ultra-bright donor and an acceptor green
 PT fluorescent protein linked by a peptide having at least one caspase
 PT cleavage site, for identifying activators or inhibitors of caspase in
 PT living cells or in vitro.

XX Disclosure; Fig 7A; 50pp; English.

XX The present invention describes a fusion protein (I) comprising of a
 CC donor green fluorescent protein (GFP) that is an ultra-bright GFP and an
 CC acceptor GFP linked by a peptide comprising at least one caspase cleavage
 CC site. AAB51201 to AAB51225 represent specifically claimed caspase
 CC cleavage site peptide sequences from the present invention. The fusion
 CC protein is useful in fluorescent resonance energy transfer (FRFT) and in
 CC the identification of activators or inhibitors of caspase activity in
 CC living cells or in vitro. Methods from the present invention can be used
 CC in the identification of caspase inhibitors which can be used in treating
 CC apoptosis, neurodegenerative diseases such as Alzheimer's disease and
 CC Parkinson's disease, traumatic brain injury, stroke, ischaemia-
 CC reperfusion injury, graft-versus-host disease and autoimmune disorders.
 CC These caspase inhibitors may also be used in clinical trial for treatment
 CC of inflammatory diseases or reduction of neuronal damage in a rabbit
 CC model of bacterial meningitis. The present sequence encodes a GFP which
 CC is used in the exemplification of the present invention

PT New isolated nucleic acid detection reagent for detecting 1000 or more
PT genes from Drosophila and for elucidating cell signalling and cell-cell
PT interactions.
XX
XX Claim 1; SEQ ID NO 10238; 21pp + Sequence Listing; English.
XX
CC The invention relates to an isolated nucleic acid detection reagent
CC capable of detecting 1000 or more genes from Drosophila. The invention is
CC useful in developmental biology and in elucidating cell signalling and
CC cell-cell interactions in higher eukaryotes for the development of
CC insecticides, therapeutics and pharmaceutical drugs. The invention
CC discloses genomic DNA sequences (ABLI16176-ABLI30511), expressed DNA
CC sequences (ABLI01840-ABLI16175) and the encoded proteins (ABBS7737-
CC ABBS72072). The sequence data for this patent did not form part of the
CC printed specification, but was obtained in electronic format directly

on the WORMPEP database can be found at
http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence
was generated from part of bacterial clone contigs of human
chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping
Group. Further information can be found at
http://www.sanger.ac.uk/HGP/Chr6
RP3-492P14 is from the library RPCI-3 constructed by the group of
Pieter de Jong. For further details see
http://www.chori.org/bacpac/home.htm
VECTOR: pCYPAC2
----- Genome Center
Center: Wellcome Trust Sanger Institute
Center code: SC
Web site: http://www.sanger.ac.uk
Contact: vegas@sanger.ac.uk

This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one subclone; and the assembly was confirmed by restriction digest,
except on the rare occasion of the clone being a YAC.

DEFINITION
HSJ492P14 121909 bp DNA linear PRI 18-MAY-2005
Human DNA sequence from clone RP3-492P14 on chromosome 6q13-15
Contains a single stranded DNA binding protein pseudogene, the TPBG
gene for trophoblast glycoprotein (5T4-AG) and a CpG island,
complete sequence.
ACCESSION
AL121977
VERSION
AL121977.11 GI:11863678

3 (bases 1 to 208078)
Rat Genome Sequencing Consortium.
Direct Submission
Submitted (15-NOV-2002) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
On Nov 15, 2002 this sequence version replaced gi:22857079.
The sequence in this assembly is a combination of BAC based reads
and whole genome shotgun sequencing reads assembled using Atlas
(http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
in the feature table below represents a scaffold in the Atlas
assembly (a 'contig-scaffold'). Within each contig-scaffold,
individual sequence contigs are ordered and oriented, and separated
by sized gaps filled with Ns to the estimated size. The sequence
may extend beyond the ends of the clone and there may be sequence
contigs within a contig-scaffold that consist entirely of whole
genome shotgun sequence reads. Both end sequences and whole genome
shotgun sequence only contigs will be indicated in the feature
table.
----- Genome Center
Center: Baylor College of Medicine
Center code: BCM
Web site: http://www.hgsc.bcm.tmc.edu/
Contact: hgsc-help@bcm.tmc.edu
----- Project Information
Center project name: GOMX
Center clone name: CH230-138L4
----- Summary Statistics
Assembly program: Phrap; version 0.990329
Consensus quality: 196804 bases at least Q40
Consensus quality: 199513 bases at least Q30
Consensus quality: 201135 bases at least Q20
Estimated insert size: 206052; sum-of-contigs estimation
Quality coverage: 7x in Q20 bases; sum-of-contigs estimation
-----

```

```

Assembly program: Atlas 3.0;
Consensus quality: 180076 bases at least Q40
Consensus quality: 185112 bases at least Q30
Consensus quality: 189119 bases at least Q20
Estimated insert size: 187073; sum-of-contigs estimation
Quality coverage: 5x in Q20 bases; sum-of-contigs estimation
-----
* NOTE: Estimated insert size may differ from sequence length
  (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
* NOTE: This is a 'working draft' sequence. It currently
  * consists of 6 contigs. The true order of the pieces
  * is not known and their order in this sequence record is
  * arbitrary. Gaps between the contigs are represented as
  * runs of N, but the exact sizes of the gaps are unknown.
  * This record will be updated with the finished sequence
  * as soon as it is available and the accession number will
  * be preserved.
*
* 1 223057: contig of 223057 bp in length
* 223058 223157: gap of unknown length
* 223158 234587: contig of 11430 bp in length
* 234588 234687: gap of unknown length
* 234688 235919: contig of 1232 bp in length
* 235920 236019: gap of unknown length
* 236020 237370: contig of 1351 bp in length
* 237371 237470: gap of unknown length
* 237471 238675: contig of 1205 bp in length
* 238676 238775: gap of unknown length
* 238776 241416: contig of 2641 bp in length.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

DR New nucleic acid associated with lactation, and muscle and fat
XX deposition, useful for genome mapping, gene identification and analysis,
PT cattle breeding, or for genetically improving cattle.
PT Claim 2; SEQ ID NO 5770; 245pp; English.
XX
XX The invention relates to a purified nucleic acid molecule associated with
CC lactation or muscle and fat deposition (designated LMFD), derived from
CC cattle, and the LMFD nucleic acid can specifically hybridise to a second
CC nucleic acid molecule comprising any of 15112 nucleotide sequences,
CC appearing as ABX34836-ABX49947, or complements of them. Also included are
CC ; (1) a transformed cell having a nucleic acid comprising an LMFD nucleic
CC acid linked to a promoter and a 3' non- translated sequence that
CC functions in the cell to cause termination of transcription and addition
CC of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and
CC (2) determining a level or pattern of a molecule in a bovine cell or
CC tissue comprising: (a) incubating a marker nucleic acid (comprising any
CC of the 15112 nucleic acid sequences or its complement or fragment) with a
CC complementary nucleic acid molecule obtained from the bovine cell or
CC tissue, where hybridisation between the marker nucleic acid and the
CC complementary nucleic acid permits the detection of the molecule; and (b)
CC detecting the level or pattern of the complementary nucleic acid, where
CC the detection of the complementary nucleic acid is predictive of the
CC level or pattern of the molecule. The LMFD nucleic acid is used for
CC determining a level or pattern of a molecule in a bovine cell or tissue.
CC It is useful for genome mapping, gene identification and analysis, cattle
CC breeding, preparation of constructs for use in cattle gene expression, or
CC for genetically improving cattle. The present sequence is one of the
CC 15112 bovine LMFD EST (expressed sequence tag) nucleic acids. Note: The
CC present sequence was not shown in the specification but was obtained in
CC electronic format from the USPTO web site:
CC seqdata.uspto.gov/sequence.html?DocID=20020137139

 XX New isolated polynucleotides, which are differentially expressed in colon
 XX cancer cell, useful for treating cancer, e.g. colon cancer, breast
 XX cancer, or pancreatic cancer.
 XX Claim 1; SEQ ID NO 2281; 97pp; English.
 XX The invention relates to 9672 polynucleotides (ACL53866-ACL63537) which
 XX are differentially expressed in colon cancer cells. The invention also
 XX relates to vectors and host cells comprising a differentially expressed
 XX polynucleotide of the invention; a method for detecting a cancerous cell
 XX by detection of a gene product of the polynucleotides; a method for
 XX inhibiting a cancerous phenotype of a cell by inhibiting a gene product
 XX of the polynucleotides; a method of treating an individual with cancer by
 XX administration of a modulator of a gene product of the polynucleotides;
 XX and an isolated antibody that specifically binds to a polypeptide encoded
 XX by one of the 9672 polynucleotides. The polynucleotides, polypeptides,
 XX antibodies, and methods are useful for the detection of cancerous cells;
 XX for the diagnosis, prognosis and management of cancer; for the
 XX identification of agents that modulate the phenotype of cancerous cells;
 XX for the identification of therapeutic targets for cancer chemotherapy;
 XX and for the treatment of cancer, especially colon cancer and metastasized
 XX colon cancer, but also breast or pancreatic cancer. The polynucleotides
 XX are also useful as a source of probes or primers for use in diagnostic
 XX methods. The differentially expressed polynucleotides or their encoded
 XX proteins can additionally be used as vaccines to modulate primary immune
 XX responses for the prevention or treatment of cancer. The present sequence
 XX represents a specifically claimed polynucleotide which is differentially
 XX expressed in colon cancer. Note: The sequence data for this patent did
 XX not form part of the printed specification, but was obtained in
 XX electronic format directly from WIPO at
 XX ftp.wipo.int/pub/published_pct_sequences

 XX Novel canine or feline 5T4 polypeptide and polynucleotides encoding the
 XX polypeptide, useful in preparation of vaccine for treating and/or
 XX preventing cancer in a subject, preferably a dog or cat.
 XX Claim 4; Page 68; 68pp; English.
 XX The present invention relates to the isolation of canine and feline
 XX oncofoetal leucine-rich glycoproteins known as 5T4, and the
 XX polynucleotide sequences encoding them. The 5T4 proteins are expressed in
 XX a significant proportion of tumours. The sequences of the invention are
 XX useful in a pharmaceutical composition for the prevention and/or
 XX treatment of tumours or other diseases associated with cell
 XX proliferation, infections, and inflammatory conditions in animals,
 XX preferably dogs or cats. The compositions may also be used for cancer
 XX immunotherapy in these animals. The sequences of the invention may also
 XX be used in diagnostic kits for rapid, reliable, sensitive, and specific
 XX measurement and localisation of 5T4 in extracts of plasma, urine,
 XX tissues, and in cell culture media. Antibodies specific for the 5T4
 XX protein are useful for isolating foetal cells from maternal blood. The
 XX isolation process may form part of a diagnostic method e.g. the foetal
 XX cells may then be subject to biochemical or genetic sampling used for
 XX testing foetal abnormalities, or to determine the sex of the foetus (ss).
 XX The present sequence encodes feline 5T4 protein

XX
XX New major histocompatibility complex class I peptide epitopes from human
PT 574 tumor-associated antigen, useful for preventing and/or treating a
PT disease, particularly cancer.
XX
XX Disclosure; Page 67; 73pp; English.
XX
XX The invention relates to a novel Major Histocompatibility Complex (MHC)
CC class I peptide epitope of the 574 antigen. The invention further
CC provides a polypeptide string comprising the 574 epitope; a nucleic acid
CC sequence encoding the 574 epitope or a polypeptide string of the 574
CC epitope; a vector system capable of delivering the 574 epitope nucleic
CC acid to a cell; a cell pulsed with the 574 epitope, a polypeptide of the
CC 574 epitope, its encoding nucleic acid, or the vector system; a vaccine
CC comprising the above; a method for treating and/or preventing a disease
CC in a subject by administering the vaccine; an agent capable of binding
CC specifically to the 574 epitope and/its encoding nucleic acid; a method
CC comprising detecting the presence of the 574 epitope or its encoding
CC nucleic acid in a subject; and a T cell line or clone capable of
CC specifically recognising the 574 epitope in conjunction with an MHC class
CC I molecule. The 574 epitope has cytostatic activity. The vaccine
CC comprising the 574 epitope or its encoding nucleic acid and the vector
CC system or cell is useful in the prevention and/or treatment of a disease,
CC particularly cancer. The detection method is useful for diagnosing or
CC monitoring the progression of a cancerous disease, and for detecting the
CC presence of the 574 epitope or its nucleic acid. The T cell line or clone
CC is useful in the manufacture of a medicament for treating and/or
CC preventing a disease. This polynucleotide sequence represents the feline
CC 574 antigen coding DNA of the invention.

XX New Major Histocompatibility Complex class II peptide epitope of 574,
PT useful for manufacturing a medicament for diagnosing, preventing and/or
PT treating a disease, e.g. cancer.
XX
XX Disclosure; Page 49; 63pp; English.
XX
XX The invention relates to a Major Histocompatibility Complex (MHC) class
CC II peptide epitope of the 574 antigen. The vaccine or T-cell line or
CC clone has a cytostatic activity, as it is useful in manufacturing a
CC medicament for preventing and/or treating a disease, particularly cancer.
CC The methods are useful for detecting T-cells capable of specifically
CC recognising a peptide epitope in conjunction with an MHC molecule, for
CC diagnosing or monitoring the progression of a cancerous disease, or for
CC detecting the presence of a peptide or nucleic acid using an agent. The
CC MHC class II peptide epitope of the invention can be used in gene therapy
CC or as part of a vaccine. This polynucleotide sequence represents the DNA
CC coding for the feline 574 protein.

 PT Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
 PT response useful in vaccinating against and in treating tumors.
 XX
 PS Example 2; Page 78; 79pp; English.
 XX
 CC The present sequence encodes the human 5T4 tumour-associated antigen
 CC (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
 CC carcinomas but has a highly restricted expression pattern in normal adult
 CC tissues. It appears to be strongly correlated to metastasis in colorectal
 CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
 CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
 CC induced were inoculated with a virus expression vector containing the
 CC present sequence. The 5T4 antigen was shown to be effective at eliciting
 CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
 CC the antigen and the antigen itself can be used to elicit an immune
 CC response, preferably CTL or an antibody response in a subject

 PT Use of single chain antibody capable of recognizing a disease associated
 PT molecule for manufacturing a medicament for preventing and/or treating a
 PT disease condition associated with disease associated molecule.
 XX
 PS Disclosure; Fig 26; 118pp; English.
 XX
 CC The specification describes the use of a single chain antibody (ScFv),
 CC which is capable of recognizing a disease associated molecule in the
 CC manufacture of a medicament for the prevention and treatment of a disease
 CC condition. The ScFv antibody is useful in the manufacture of a
 CC medicament, for affecting a disease in vivo, for preparing a
 CC pharmaceutical composition, for in vivo imaging and/or for adjuvant
 CC treatment of a disease. The ScFv antibody is also useful for treating
 CC inflammatory diseases including arthritis, hypersensitivity, autoimmune
 CC diseases, cancers, central nervous system disorders including Parkinson's
 CC disease, periodontal diseases, cardiopulmonary diseases, cardiovascular
 CC diseases, gastrointestinal disorders, infections, diabetes, Helicobacter-
 CC related diseases, and other immune disorders. The present sequence
 CC encodes a 5T4 protein, which is used to produce ScFv of the invention

XX PT Novel canine or feline 5T4 polypeptide and polynucleotides encoding the
XX PT polypeptide, useful in preparation of vaccine for treating and/or
XX PT preventing cancer in a subject, preferably a dog or cat.
XX PS Claim 1; Page 67; 68pp; English.
XX CC The present invention relates to the isolation of canine and feline
XX CC oncofoetal leucine-rich glycoproteins known as 5T4, and the
XX CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in
XX CC a significant proportion of tumours. The sequences of the invention are
XX CC useful in a pharmaceutical composition for the prevention and/or
XX CC treatment of tumours or other diseases associated with cell
XX CC proliferation, infections, and inflammatory conditions in animals,
XX CC preferably dogs or cats. The compositions may also be used for cancer
XX CC immunotherapy in these animals. The sequences of the invention may also
XX CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
XX CC measurement and localisation of 5T4 in extracts of plasma, urine,
XX CC tissues, and in cell culture media. Antibodies specific for the 5T4
XX CC protein are useful for isolating foetal cells from maternal blood. The
XX CC isolation process may form part of a diagnostic method e.g. the foetal
XX CC cells may then be subject to biochemical or genetic sampling used for
XX CC testing foetal abnormalities, or to determine the sex of the foetus(es).
XX CC The present sequence encodes canine 5T4 protein

XX PR New genes regulated by MYCN activation, useful in gene therapy,
PT particularly for treating a subject with e.g. neuroblastoma or other
PT cancers, or for diagnosing, staging or monitoring the treatment of the
PT cancer.
XX PS Claim 1; SEQ ID NO 105; 27pp; English.
XX CC This invention relates to novel isolated cDNAs that are differentially
XX expressed in MYCN activated cells. Specifically, it refers to
CC polynucleotide sequences that exhibit differential expression patterns in
CC cells activated by the transactivator MYCN, where MYCN is a proto-
CC oncogene that is amplified in neuroblastoma cells and is common in small
CC cell lung cancers. The present invention describes these cDNA molecules
CC as useful for in hybridisation assays to detect expression of nucleic
CC acids (or complementary nucleic acids) in a present in a given sample, as
CC well as for screening assays by identifying molecules or compounds that
CC specifically bind the cDNA as a ligand and modulate function or activity.
CC Accordingly, these compositions exhibit cytostatic activity and can also
CC be used for gene therapy purposes. This polynucleotide sequence is a cDNA
CC that is differentially expressed in MYCN activated cells, given in an
CC exemplification of the invention. NOTE: This sequence does not appear in
CC the printed specification but has been obtained in electronic format from
CC the US Patent Office at
CC ftp.segdata.uspto.gov/sequence.html?docID=20030119009.

XX Detecting a bladder cancer-associated transcript in a cell from a
PT patient, comprises contacting a biological sample from the patient with a
PT bladder cancer-associated polynucleotide or antibody.
XX
XX Claim 6; Page 296; 307pp; English.

XX CC The present invention describes a method for detecting a bladder cancer-
XX associated transcript in a cell from a patient. The method comprises
CC contacting a biological sample from the patient with a polynucleotide
CC that selectively hybridises to a sequence that is 80 % identical to a
CC table of sequences (see ACC50951 to ACC51059). ACC50951 to ACC51059
CC encode the human bladder cancer-associated proteins given in ABR48146 to
CC ABR48242). Bladder cancer-associated sequences from the present invention
CC have cytostatic activities, and can be used in antisense gene therapy and
CC in vaccine production. The method can be used for detecting a bladder
CC cancer-associated transcript in a cell from a patient. The method is
CC useful in diagnosing or treating bladder cancer and in screening for
CC compounds that modulate bladder cancer, such as hormones or antibodies.
CC The nucleic acid molecules from the present invention may be used in
CC various screening and diagnostic methods, and for gene therapy, vaccine
CC and/or antisense/inhibition applications

XX Detecting a lung cancer-associated transcript in a cell from a patient

PT for treating lung cancer, by contacting a biological sample from the

PT patient with a polynucleotide that exhibits increased or decreased

PT expression in lung cancer.

XX Claim 22; Page 335; 453pp; English.

XX The invention relates to a method for detecting a lung cancer-associated

CC transcript in a cell from a patient, comprising contacting a biological

CC sample from the patient with a polynucleotide that selectively hybridises

CC to a sequence that is at least 80 % identical to a gene that exhibits

CC increased or decreased expression in lung cancer samples. Lung cancer-

CC associated polynucleotides and polypeptides are used for identifying a

CC compound that modulates a lung cancer-associated polypeptide, for

CC inhibiting proliferation of a lung cancer-associated cell to treat lung

CC cancer in a patient and for treating a mammal having lung cancer by

CC administering a modulatory compound identified. The methods are useful

CC for treating lung cancer, such as small cell lung cancer, non-small cell

CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,

CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,

CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and

CC bronchiectasis. The genes, polynucleotides and polypeptides are useful

CC for diagnostic purposes and as targets for screening for therapeutic

CC compounds that modulate lung cancer, such as antibodies. Sequences

CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the

CC invention

 XX Determining the presence or absence of a pathological cell in a patient,
 PT useful for diagnosing, prognosing or treating cancer, comprises detecting
 PT a nucleic acid in a biological sample.
 XX
 XX Claim 8; SEQ ID NO 39; 1385pp; English.
 XX
 CC The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
 CC whose expression is upregulated or downregulated in specific cancers or
 CC other diseases such as angiogenic or fibrotic disorders, and to methods
 CC of determining the presence or absence of a pathological cell in a
 CC patient by detecting a nucleic acid at least 80% identical to those of
 CC the invention or by detecting a polypeptide of the invention. The
 CC invention also relates to expression vectors and host cells comprising a
 CC nucleic acid of the invention; antibodies which specifically bind a
 CC polypeptide of the invention; use of such antibodies for drug targeting;
 CC and methods of screening for modulators of activity or expression of the
 CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
 CC antibodies and methods are useful for diagnosing, prognosing and treating
 CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
 CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
 CC neovascularisation syndromes, scarring and uterine fibroids. They may
 CC also be useful in wound healing and in contraception. The present
 CC sequence represents a nucleic acid sequence of the invention.

XX PT New antibody that binds to a tumor-associated antigenic target (TAT)
XX PT polypeptide, useful for preparing a composition for diagnosing or
XX PT treating cancer.
XX PS Claim 1; SEQ ID NO 53; 319pp; English.
XX CC The present invention relates to the isolation of human tumour-associated
XX CC antigenic target (TAT) polynucleotide and polypeptide sequences. Also
XX CC disclosed is an antibody that binds to a TAT polypeptide. The antibody is
XX CC a monoclonal antibody, an antibody fragment, a chimeric antibody or a
XX CC humanised antibody. It is conjugated to a growth inhibitory agent. It is
XX CC produced in bacteria or in CHO cells and induces death of a cell to which
XX CC it binds. The antibody is useful for preparing a composition for
XX CC diagnosing or treating tumours and cancer. The present sequence
XX CC represents a human TAT cDNA sequence of the invention.

 PT Identifying a compound that can treat disease or disorders, such as, a
 PT neuropsychiatric disorder e.g., schizophrenia, or autism, comprises
 PT determining the expression of one or more efficacy genes in a cell
 PT contacted with the test compound.
 XX
 PS Example 6; SEQ ID NO 174; 39pp; English.
 XX
 CC This invention relates to a novel screening method identified as a multi-
 CC parameter high throughput screening (MPHTS) assay. Specifically, it
 CC refers to an assay that utilizes the disease signature of a plurality of
 CC specific genes associated with a particular disease, and identifies
 CC differential expression between those cells taken from individuals
 CC affected by that disease and those that are not affected. The present
 CC invention then describes the screening of candidate pharmaceutical
 CC compounds to identify those that have a potential therapeutic benefit for
 CC the treatment of neuropsychiatric and neurodegenerative disorders
 CC including schizophrenia, bipolar affective disorder (BAD) and autism, as
 CC well as Parkinson's and Alzheimer's disease. Accordingly, the compounds
 CC of this invention exhibit various activities including neuroleptic,
 CC neurotropic, antianemic and antidepressant. Furthermore, the screening
 CC method used in MPHTS will be automated, such that a large number of test
 CC compounds may be rapidly screened with a minimal amount of labour and
 CC effort. This polynucleotide is a human cDNA sequence of a gene that is
 CC differentially expressed in the presence of a therapeutic compound and
 CC represents an exemplary efficacy gene for bipolar affective disorder,
 CC given in an exemplification of the invention.

 PT diagnostics, forensics, gene mapping, identification of mutations
 PT responsible for genetic disorders or other traits and to assess
 PT biodiversity.
 XX
 PS Claim 1; SEQ ID NO 22979; 103pp; English.
 XX
 CC The invention relates to isolated polynucleotide (I) and polypeptide (II)
 CC sequences. (I) is useful as hybridisation probes, polymerase chain
 CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping.
 CC and in recombinant production of (II). The polynucleotides are also used
 CC in diagnostics as expressed sequence tags for identifying expressed
 CC genes. (I) is useful in gene therapy techniques to restore normal
 CC activity of (II) or to treat disease states involving (II). (II) is
 CC useful for generating antibodies against it, detecting or quantitating a
 CC polypeptide in tissue, as molecular weight markers and as a food
 CC supplement. (II) and its binding partners are useful in medical imaging
 CC of sites expressing (II). (I) and (II) are useful for treating disorders
 CC involving aberrant protein expression or biological activity. The
 CC polypeptide and polynucleotide sequences have applications in
 CC diagnostics, forensics, gene mapping, identification of mutations
 CC responsible for genetic disorders or other traits to assess biodiversity
 CC and to produce other types of data and products dependent on DNA and
 CC amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
 CC coding sequences of the invention. Note: The sequence data for this
 CC patent did not appear in the printed specification, but was obtained in
 CC electronic format directly from WIPO at

 XX
 CC The invention relates to a purified protein promoting signal transducer
 CC and activator of transcription 6 activation (STAT6). The protein is
 CC useful for the producing an antibody, which involves administering the
 CC protein or its epitope-bearing fragments to a non-human animal as an
 CC antigen. The nucleic acid is useful for diagnosing a disease or
 CC susceptibility to a disease related to expression or activity of the
 CC protein. A transformant expressing the protein is useful for screening
 CC compounds which inhibit or promote STAT6 activation. A transformant
 CC expressing the protein is useful for producing a pharmaceutical
 CC composition. Compositions, antibodies and antisense molecules are useful
 CC for the treating a disease associated with STAT6 activation such as
 CC allergic diseases, inflammation, autoimmune diseases, diabetes,
 CC hyperlipidaemia, infections disease and cancers. Compositions are useful
 CC for treating disease associated with STAT6 activation and/or prevention
 CC of Th1 hyperactive diseases. Compositions are also useful in rheumatoid
 CC arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,
 CC allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,
 CC viral hepatitis and AIDS. The protein has efficient promoting STAT6
 CC activity. The protein or nucleic acid is effectively useful for screening
 CC compounds for treating and preventing disease associated with excessive
 CC activation or inhibition of STAT6. The present sequence represents a
 CC human cDNA encoding a protein which promotes STAT6 activation.

 XX
 XX New oligonucleotide primers (830 cDNAs) useful for synthesizing full
 PT length human cDNAs.
 PT
 XX Example 1; SEQ ID NO 2866; 1340pp; English.
 PS
 XX This invention relates to a novel primers useful for synthesizing full
 CC length cDNA molecules that encode human proteins. Specifically, it refers
 CC to secretory or membrane proteins that are potential therapeutic agents/
 CC target molecules in the field of medicine, and in particular genes
 CC encoding proteins that are associated with signal transduction,
 CC glycoproteins and transcription. The present invention describes a method
 CC for efficiently cloning a full length human cDNA from both the 5' and 3'
 CC ends using the oligo-capping method. This polynucleotide sequence is a
 CC full length human cDNA clone of the invention.

 XX
 XX Detecting a breast cancer-associated transcript in a patient's cell,
 PT useful for diagnosing breast cancer, comprises contacting a biological
 PT sample with a polynucleotide that selectively hybridizes with breast
 PT cancer nucleic acids.
 XX
 XX Claim 9; Page 372; 414pp; English.
 PS
 XX The invention comprises a method of detecting a breast cancer-associated
 CC transcript in a cell from a patient. The method of the invention involves
 CC contacting a biological sample from the patient with a nucleotide that
 CC hybridizes to one of the 69 breast cancer-associated gene sequences shown
 CC in the specification. The method of the invention is useful in the
 CC diagnosis or prognosis of breast cancer, and for detecting genes that are
 CC up or down-regulated in breast cancer cells. Genes identified by the
 CC method of the invention can be used in diagnostic purposes and also as
 CC targets for screening for therapeutic compounds that modulate breast
 CC cancer (e.g. hormones or antibodies). Identification of genes that are
 CC over or under expressed in breast cancer can additionally provide high-
 CC resolution, high-sensitivity datasets which can be used in the areas of
 CC diagnostics, therapeutics, drug development, pharmacogenetics, protein
 CC structure and biosensor development. DNA sequences ABT07693 - ABT07761
 CC represent the 69 breast cancer-associated gene sequences of the invention

XX
XX Detecting a lung cancer-associated transcript in a cell from a patient
PT for treating lung cancer, by contacting a biological sample from the
PT patient with a polynucleotide that exhibits increased or decreased
PT expression in lung cancer.
XX
XX Claim 22; Page 336; 453pp; English.
XX
XX The invention relates to a method for detecting a lung cancer-associated
CC transcript in a cell from a patient, comprising contacting a biological
CC sample from the patient with a polynucleotide that selectively hybridizes
CC to a sequence that is at least 80 % identical to a gene that exhibits
CC increased or decreased expression in lung cancer samples. Lung cancer-
CC associated polynucleotides and polypeptides are used for identifying a
CC compound that modulates a lung cancer-associated polypeptide, for
CC inhibiting proliferation of a lung cancer-associated cell to treat lung
CC cancer in a patient and for treating a mammal having lung cancer by
CC administering a modulatory compound identified. The methods are useful
CC for treating lung cancer, such as small cell lung cancer, non-small cell
CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
CC for diagnostic purposes and as targets for screening for therapeutic
CC compounds that modulate lung cancer, such as antibodies. Sequences
CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
CC invention

XX
XX Detecting an ovarian cancer-associated transcript in a cell from a
PT patient, comprises contacting a biological sample from the patient with a
PT polynucleotide that hybridizes to an ovarian cancer gene.
XX
XX Claim 10; Page 297; 332pp; English.
XX
XX The invention relates to a method of detecting an ovarian cancer-
CC associated transcript in a cell from a patient, by contacting a
CC biological sample from the patient with a polynucleotide that selectively
CC hybridizes to a sequence at least 80 % identical to any of one of 80
CC nucleic acid sequences given in the specification. The method is useful
CC in diagnosing ovarian cancer and in identifying and using agents and/or
CC targets that inhibit ovarian cancer. The nucleic acid molecule,
CC polypeptide and the antibody may also be used in detecting ovarian
CC cancer, monitoring and early detection of relapse following treatment,
CC monitoring response to therapy, selecting patients for post-operative
CC chemotherapy or radiation therapy, in selecting mode of therapy,
CC chemotherapeutic tumour prognosis, early detection of pre-cancerous lesions,
CC and as vaccines. This sequence corresponds to one of the nucleic acids
CC used for the detection method of the invention.

XX XX
CC The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
CC whose expression is upregulated or downregulated in specific cancers or
CC other diseases such as angiogenic or fibrotic disorders, and to methods
CC of determining the presence or absence of a pathological cell in a
CC patient by detecting a nucleic acid at least 80% identical to those of
CC the invention or by detecting a polypeptide of the invention. The
CC invention also relates to expression vectors and host cells comprising a
CC nucleic acid of the invention; antibodies which specifically bind a
CC polypeptide of the invention; use of such antibodies for drug targeting;
CC and methods of screening for modulators of activity or expression of the
CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
CC antibodies and methods are useful for diagnosing, prognosing and treating
CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
CC neovascularisation syndromes, scarring and uterine fibroids. They may
CC also be useful in wound healing and in contraception. The present
CC sequence represents a nucleic acid sequence of the invention.

New NOVX polypeptides and polynucleotides, useful for preventing,
 diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer,
 Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic
 disorders, and asthma.

Claim 16; Page 114-115; 619pp; English.

The present invention relates to new isolated proteins (NOVX) and their coding sequences (ABV95327-ABV95955 and ABP70049-ABP70149), where X is any number from 1 to 48. The NOVX proteins and coding sequences are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The NOVX coding sequences and proteins are useful for treating, preventing or diagnosing diseases such as metabolic disorders, diabetes, obesity, infectious disease, anorexia, cancer-associated cachexia, cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's disease, immune disorders, haematopoietic disorders, cardiovascular disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic disturbances associated with obesity, metabolic syndrome X or wasting disorders associated with chronic diseases or various cancers. The NOVX coding sequences and proteins may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnostic methods.

PT Enterococcus faecium polypeptide useful for detection, prevention and treatment of a pathological condition resulting from a bacterial infection.

PS Example 1: SEQ ID NO 1806; 243pp; English.

The invention relates to an isolated nucleic acid derived from *Enterococcus faecium* encoding an *Enterococcus faecium* polypeptide having one of 10 fully defined sequences given in the (or comprising 40 sequential nucleotides chosen from any of the nucleic acids, its complement or sequences hybridising to it). Also included are a recombinant vector comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a single-stranded probe comprising the nucleic acid. The nucleic acids are chosen from 354 disclosed sequences encoding 354 disclosed proteins. The nucleic acids is useful for diagnosing pathological conditions resulting from *E. faecium* bacterial infection (e.g. urinary tract infection, bacteraemia, endocarditis, wounds and abdominal pelvic infection) and for screening drugs such as agonists and antagonists. The nucleic acid is useful for recombinant production of *Candida albicans* - derived peptides or antisense polypeptides. Pharmaceutical compositions and vaccines containing the nucleic acid are useful for preventing or treating *Enterococcus faecium* infections. The present sequence represents one if the disclosed *E. faecium* nucleic acids.

Tumor associated antigen, 574 capable of eliciting cytotoxic T-lymphocyte
PT response useful in vaccinating against and in treating tumors.
XX
PS Example 2; Page 78; 79pp; English.
XX

The present sequence encodes the mouse 574 tumour-associated antigen
CC (TAA). The TAA 574 is a glycoprotein which is widely expressed in
CC carcinomas but has a highly restricted expression pattern in normal adult
CC tissues. It appears to be strongly correlated to metastasis in colorectal
CC and gastric cancer. 574 antigen may therefore be useful in tumour
CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
CC induced were inoculated with a virus expression vector containing the
CC present sequence. The 574 antigen was shown to be effective at eliciting
CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
CC the antigen and the antigen itself can be used to elicit an immune
CC response, preferably CTL or an antibody response in a subject. The
CC present sequence appears in GenBank at accession number A012160

New signal transducer and activator of transcription 6 activation
PT promoting purified protein, for diagnosing and treating disease
PT associated with activation/inhibition of transcription factor e.g.
PT diabetes and cancer.
XX
PS Claim 4; SEQ ID NO 125; 1369pp; English.
XX

The invention relates to a purified protein promoting signal transducer
CC and activator of transcription 6 activation (STAT6). The protein is
CC useful for the producing an antibody, which involves administering the
CC protein or its epitope-bearing fragments to a non-human animal as an
CC antigen. The nucleic acid is useful for diagnosing a disease or
CC susceptibility to a disease related to expression or activity of the
CC protein. A transformant expressing the protein is useful for screening
CC compounds which inhibit or promote STAT6 activation. A transformant
CC expressing the protein is useful for producing a pharmaceutical
CC composition. Compositions, antibodies and antisense molecules are useful
CC for the treating a disease associated with STAT6 activation such as
CC allergic diseases, inflammation, autoimmune diseases, diabetes,
CC hyperlipidaemia, infections disease and cancers. Compositions are useful
CC of Th1 hyperactive diseases. Compositions are also useful in rheumatoid
CC arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,
CC allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,
CC viral hepatitis and AIDS. The protein has effectively promoting STAT6
CC activity. The protein or nucleic acid is effectively useful for screening
CC compounds for treating and preventing disease associated with excessive
CC activation or inhibition of STAT6. The present sequence represents a
CC human cDNA encoding a protein which promotes STAT6 activation.

XX
XX Constructing strains for identifying gene products as effective targets
PT for therapeutic intervention, by inactivating in the strain one allele of
PT a gene and placing other allele of the gene under conditional expression.
XX
XX Claim 37; SEQ ID NO 6713; 167pp + Sequence Listing; English.
XX
XX The invention relates to constructing (M1) a strain of diploid fungal
CC cells in which both alleles of a gene are modified, comprising modifying
CC one allele by insertion or replacement by a cassette having an
CC expressible selectable marker and modifying other allele by
CC recombination, of a promoter replacement fragment with a heterologous
CC promoter, so that expression of the second allele is regulated by the
CC promoter. (M1) is useful for constructing a strain of diploid fungal
CC cells in which both alleles of a gene are modified. The diploid fungal
CC cells having both alleles modified are useful for identifying a gene that
CC is essential to the survival or growth of a fungus, a gene that
CC contributes to the virulence and/or pathogenicity of a fungus, a gene
CC that contributes to the resistance of a diploid fungus to an antifungal
CC agent, an antifungal agent that inhibits the growth of a diploid fungus
CC and for identifying a therapeutic agent for treatment of a mammalian
CC disease. (M1) is useful for identifying a compound which modulates the
CC activity of a gene product, preferably enzymatic activity, carbon
CC compound catabolism, biosynthesis, transporter, transcriptional,
CC translational, signal transduction, DNA replication and cell division
CC activity. The method is useful for identifying a compound having the
CC ability to inhibit growth or proliferation of C. albicans cells and for
CC treating infection by C. albicans. The present sequence is that of an
CC essential Candida albicans gene used in the method of the invention.
CC Note: The sequence data for this patent is not represented in the printed
CC specification but is based on sequence information supplied to Derwent by
CC the European Patent Office

 PT Human proteins and DNA encoding sequences useful for preventing, treating
 PT or ameliorating a medical condition in a mammalian subject e.g. arthritis
 PT and cancer.
 XX
 PS Claim 1; Page 765-766; 1963pp; English.
 XX
 CC Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and
 CC sequences ABA08225-ABA09574 represent nucleic acids encoding them. The
 CC invention also relates to vectors and recombinant host cells comprising a
 CC nucleotide of the invention, methods of producing the novel polypeptides,
 CC antibodies against the polypeptides, methods of detecting the nucleotides
 CC or polypeptides in a sample, and methods of identifying compounds which
 CC bind to polypeptides of the invention. Although novel, many of the
 CC polypeptides of the invention have homology to known proteins, thereby
 CC giving an insight into their probable biological activities, and hence
 CC potential therapeutic applications. The polypeptides of the invention may
 CC have various activities, including cytokine, cell proliferation or cell
 CC differentiation activities; stem cell growth factor activity;
 CC haematopoiesis regulatory activity; tissue growth activity;
 CC immunomodulatory activity; activin- or inhibin-related activities;
 CC thrombotic or chemokinetic activities; haemostatic, thrombotic or
 CC thrombolytic activities; receptor or ligand activities; or may be
 CC involved in oncogenesis, cancer cell proliferation or metastasis.
 CC Depending on their biological activities, polypeptides and nucleotides of
 CC the invention are useful for preventing, treating or ameliorating medical
 CC conditions, e.g., by protein or gene therapy. Such conditions include
 CC cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell
 CC disorders), chronic inflammatory conditions (e.g., asthma or arthritis),
 CC proliferative retinopathy, atherosclerosis, coronary heart disease,
 CC arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal
 CC vascular growth. Polypeptides involved with tissue regeneration and
 CC repair (or nucleic acids encoding them) may be used to promote wound
 CC healing (e.g., of burns, incisions and ulcers), while those with
 CC immunomodulatory activities may be used in the treatment of viral,
 CC bacterial and fungal infections in addition to immune disorders.

CC Polypeptides with growth factor activity may be used in cell cultures to
 CC promote cell growth. For example, such polypeptides may be used to
 CC manipulate stem cells in culture to give rise to neuroepithelial cells
 CC that can be used to augment or replace cells damaged by illness,
 CC autoimmune disease or accidental damage. The polypeptides and nucleotides
 CC may also be used in the diagnosis of the above conditions, and in drug
 CC screening techniques. The present sequence represents a cDNA encoding a
 CC novel human polypeptide of the invention

 PT obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for
 PT diagnostic, forensic, gene therapy and chromosome mapping procedures.
 XX
 PS Claim 1; SEQ ID NO 704; 71pp + Sequence Listing; English.
 XX
 CC The present sequence is one of a large number of 5' ESTs derived from
 CC mRNAs encoding secreted proteins. An ORF has been identified within the
 CC sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs
 CC derived from 30 different tissues. EST sequences usually correspond
 CC mainly to the 3' untranslated region (UTR) of the mRNA because they are
 CC often obtained from oligo-dT primed cDNA libraries. Such ESTs are not
 CC well suited for isolating cDNA sequences derived from the 5' ends of
 CC mRNAs and even in those cases where longer cDNA sequences have been
 CC obtained, the full 5' UTR is rarely included. 5' ESTs are derived from
 CC mRNAs with intact 5' ends and can therefore be used to obtain full length
 CC cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic,
 CC gene therapy and chromosome mapping procedures. They are used to obtain

CC upstream regulatory sequences and to design expression and secretion
 CC vectors

 FT New antisense nucleic acids, useful for identifying proteins or screening
 FT for homologous nucleic acids required for cellular proliferation to
 FT isolate candidate molecules for rational drug discovery programs.
 XX
 PS Claim 14; SEQ ID NO 35957; 1766pp; English.
 XX
 CC The invention relates to an isolated nucleic acid comprising any one of
 CC the 6213 antisense sequences given in the specification where expression
 CC of the nucleic acid inhibits proliferation of a cell. Also included are:
 CC (1) a vector comprising a promoter operably linked to the nucleic acid
 CC encoding a polypeptide whose expression is inhibited by the antisense
 CC nucleic acid; (2) a host cell containing the vector; (3) an isolated
 CC polypeptide or its fragment whose expression is inhibited by the
 CC antisense nucleic acid; (4) an antibody capable of specifically binding
 CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
 CC proliferation or the activity of a gene in an operon required for
 CC proliferation; (7) identifying a compound that influences the activity of
 CC the gene product or that has an activity against a biological pathway
 CC required for proliferation, or that inhibits cellular proliferation; (8)

CC identifying a gene required for cellular proliferation or the biological
 CC pathway in which a proliferation-required gene or its gene product lies
 CC or a gene on which the test compound that inhibits proliferation of an
 CC organism acts; (9) manufacturing an antibiotic; (10) profiling a
 CC compound's activity; (11) a culture comprising strains in which the gene
 CC product is overexpressed or underexpressed; (12) determining the extent
 CC to which each of the strains is present in a culture or collection of
 CC strains; or (13) identifying the target of a compound that inhibits the
 CC proliferation of an organism. The antisense nucleic acids are useful for
 CC identifying proteins or screening for homologous nucleic acids required
 CC for cellular proliferation to isolate candidate molecules for rational
 CC drug discovery programs, or for screening homologous nucleic acids
 CC required for proliferation in cells other than *S. aureus*, *S. typhimurium*,
 CC *K. pneumoniae* or *P. aeruginosa*. Note: The present sequence is one of the target
 CC prokaryotic essential genes. Note: The sequence data for this patent did
 CC not form part of the printed specification, but was obtained in
 CC electronic format directly from WIPO at
 CC ftp.wipo.int/pub/published_pct_sequences

 FT aplastic anemia or cancer for promoting wound healing.
 XX
 PS Example 2; SEQ ID NO 1822; 718pp; English.

CC The invention relates to a novel isolated polynucleotide and the encoded
CC polypeptide. The molecules of the invention demonstrate antiinflammatory,
CC neuroprotective, antianaemic, cytostatic and vulnerary activities and may
CC be useful in preparing a composition for diagnosing or treating
CC inflammatory, haematopoietic, immune, neurodegenerative or stem cell
CC disorders, such as aplastic anaemia or cancer, as well as for promoting
CC wound healing. The molecules may also be utilised during gene therapy
CC procedures. The current sequence is that of a human therapeutic contig
CC DNA of the invention. The current sequence is not shown explicitly within
CC the specification but can be accessed from the WIPO web-site.

 XX XX New stress-responsive nucleic acid, useful for altering the
 XX PT responsiveness of a plant, e.g. cereal, to an abiotic stress such as cold
 XX PT stress, salt stress or osmotic stress.
 XX PS Claim 1; SEQ ID NO 2810; 89pp; English.
 XX XX The invention relates to novel abiotic stress responsive polynucleotides
 XX CC and polypeptides. Also disclosed are vectors, expression cassettes, host
 XX CC cells, and plants containing such polynucleotides. Also disclosed are
 XX CC methods for using the polynucleotides and polypeptides to alter the
 XX CC responsiveness of a plant to abiotic stress. The invention is useful in
 XX CC agriculture. The nucleic acid is useful for determining whether a test
 XX CC plant has been exposed to an abiotic stress condition. It is also useful
 XX CC for selecting an agent that alters abiotic stress regulated
 XX CC polynucleotide expression in a plant cell, and to identify a homolog or
 XX CC ortholog to an abiotic stress responsive polynucleotide. The nucleic acid
 XX CC molecule and the polypeptide encoded by it are useful in altering the
 XX CC responsiveness of a plant to an abiotic stress, such as cold stress, salt
 XX CC stress, osmotic stress or any of their combinations. The present sequence
 XX CC is used in the exemplification of the invention

 XX XX New isolated polynucleotides and polypeptides associated with isoprenoid
 XX PT synthesis in plants, useful for producing transgenic plants, for targeted
 XX PT gene disruption, as well as markers or probes.
 XX PS Claim 1; SEQ ID NO 273; 117pp; English.
 XX CC The invention relates to a polynucleotide (or its complement, protein
 XX CC encoding fragment or reverse complement), comprising a nucleotide
 XX CC sequence encoding a polypeptide comprising an amino acid sequence
 XX CC involved in or associated with the biosynthesis of isoprenoids in a rice
 XX CC plant. Also included are an isolated polypeptide involved in or
 XX CC associated with the biosynthesis of isoprenoids in a plant, an expression
 XX CC cassette comprising the polynucleotide, a host cell comprising the
 XX CC expression cassette, and a transgenic plant comprising the expression
 XX CC cassette. The polypeptides and polynucleotides include those associated
 XX CC with the biosynthesis of isopentenyl diphosphate (IPP) and dimethylallyl
 XX CC alcohol (DMAPP), the biosynthesis of short-chain plastid
 XX CC prenyltransferases, the biosynthesis of gibberellins, the biosynthesis of
 XX CC carotenoids and/or abscisic acids, the biosynthesis of tocopherols,
 XX CC plastoquinone and/or phytylquinone biosynthesis, the mevalonate pathway,
 XX CC phytyl and brassinosteroid metabolism, biosynthesis of ubiquinone,
 XX CC biosynthesis of monoterpenes and sesquiterpenes, protein prenylation, and
 XX CC biosynthesis of chlorophyll or haeme. Also disclosed are banana, wheat
 XX CC and corn homologues of some of the rice polynucleotides. The
 XX CC polynucleotides are useful for producing transgenic plants, where the
 XX CC genome is augmented by a nucleic acid molecule of the invention, or in
 XX CC which the corresponding gene has been disrupted, e.g. to result in a
 XX CC loss, a decrease or an alteration in the function of the product encoded
 XX CC by the gene. The plants may also have increased yields and/or produce a
 XX CC better quality product than the corresponding wild-type plant. The
 XX CC nucleic acid molecules are useful for targeted gene disruption, as well
 XX CC as markers and probes. Note: The sequence data for this patent did not
 XX CC form part of the printed specification, but was obtained in electronic
 XX CC format directly from USPTO at
 XX CC seqdata.uspto.gov/sequence.html?DocID=20040010815. The present sequence
 XX CC is a Rice isoprenoid biosynthesis-associated cDNA of the invention.

PT New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
XX
PS Claim 1; SEQ ID NO 20857; 103pp; English.
XX

CC The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping. CC and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

PT New recombinant nucleic acid encoding carcinoma associated protein, useful for preparing compositions for treating carcinomas.
XX
PS Claim 1; SEQ ID NO 1316; 245pp; English.
XX

CC The invention relates to recombinant carcinoma associated (CA) nucleic acid sequences from mouse and human (ADA01482-ADA03094), and to recombinant carcinoma associated proteins (CAP) encoded by them. The invention also encompasses expression vectors and host cells comprising a CA nucleic acid, a polypeptide (especially an antibody) that specifically binds to the protein, and a biochip comprising CA nucleic acid or fragments thereof. The sequences of the invention were identified using oncogenic retroviruses, which insert into the genome of the host organism at random. Many of these do not carry transduced host oncogenes or pathogenic trans-acting viral genes, meaning that cancer incidence is a direct consequence of the effects of proviral integration into host protooncogenes. The CA nucleic acid sequences can be used to diagnose carcinoma (especially breast cancer, prostate cancer, lymphoma or leukaemia) or a propensity to carcinoma by determination of the sequence of a CA gene, or by determination of CA gene expression in particular tissues. CA nucleic acids, proteins and antibodies are also useful as therapeutic agents and in screening and evaluating drug candidates. The present sequence represents a specifically claimed human CA nucleic acid sequence of the invention. Note: The complete sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

HSJ492P14 121909 bp DNA linear PRI 18-MAY-2005
LOCUS Human DNA sequence from clone RP3-492P14 on chromosome 6q13-15
DEFINITION Contains a single stranded DNA binding protein pseudogene, the TPBG
gene for trophoblast glycoprotein (5T4-AG) and a CpG island, the
complete sequence.
AUI21977
VERSION AUI21977.11 GI:11863678
KEYWORDS HTG; CpG island; TPBG.
SOURCE Homo sapiens
ORGANISM Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Euarchontoglires; Primates; Catarrhini;
Hominiidae; Homo.
1 (bases 1 to 121909)
Direct Submission
Submitted (13-MAY-2005) Wellcome Trust Sanger Institute, Hinxton,
Cambridgeshire, CB10 1SA, UK. E-mail enquiries: vegas@sanger.ac.uk
Clone requests: clonerequest@sanger.ac.uk
On Dec 15, 2000 this sequence version replaced gi:11558491.
The following abbreviations are used to associate primary accession
numbers given in the feature table with their source databases:
Emn, EMBL; Sw, SWISSPROT; Tr, TREMBL; Wp, WORMPEP; Information
on the WORMPEP database can be found at
http://www.sanger.ac.uk/Projects/C/elephants/wormpep This sequence
was generated from part of bacterial clone contigs of human
chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping
Group. Further information can be found at
http://www.sanger.ac.uk/HGP/Chr6
```

RP3-492P14 is from the library RPCI-3 constructed by the group of
Piter de Jong. For further details see

Contact: vegas@sanger.ac.uk

This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one subclone; and the assembly was confirmed by restriction digest,
except on the rare occasion of the clone being a YAC.

-----
Center project name: H_NH0792N18

NOTICE: This sequence may not represent the entire insert of this
clone. It may be shorter because we only sequence overlapping
clone sections once, or longer because we provide a small overlap
between neighboring data submissions.

This sequence was finished as follows unless otherwise noted:
all regions were double stranded, sequenced with an alternate
chemistry, or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by sequence
from more than one subclone; and the assembly was confirmed by
restriction digest.

MAPPING INFORMATION:
The sequence of this clone was established as part of a mapping and
sequencing collaboration between the NHGRI Chromosome 7 Mapping
project (Eric D. Green, Director), John D. McPherson in the
Department of Genetics (Washington University), and the Washington
University Genome Sequencing Center. For additional information
about the map position of this sequence, see
http://www.nhgri.nih.gov/DIR/GRB/CHR7 , send
mailto:egreen@nhgri.nih.gov , or see http://genome.wustl.edu/gsc

SOURCE INFORMATION:
The RPCI-11 human BAC library was made from the blood of one male
donor, as described by Osoegawa,K., Woon,P.Y., Zhao,B., Frengen,E.,
Tateno,M., Catanese,J.J. and de Jong,P.J. (1998) An improved
approach for construction of bacterial artificial chromosome
libraries. Genomics 51:1-8. The clone may be obtained either from
Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong
and coworkers at the Roswell Park Cancer Institute
(http://bacpac.med.buffalo.edu)

TITLE	Direct Submission
JOURNAL	Submitted (01-JUL-2005) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
COMMENT	On Jun 29, 2005 this sequence version replaced gi:62821922. The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas

assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

----- Project Information
Center project name: PFEX
Center clone name: CH240-79C10
----- Summary Statistics
Assembly program: Atlas 3.0;
Consensus quality: 202990 bases at least Q40
Consensus quality: 204529 bases at least Q30
Consensus quality: 205759 bases at least Q20
Estimated insert size: 207978; sum-of-contigs estimation
Quality coverage: 5x in Q20 bases; sum-of-contigs estimation

* NOTE: Estimated insert size may differ from sequence length
(see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
* NOTE: This is a 'working draft' sequence. It currently
* consists of 16 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence.
* as soon as it is available and the accession number will
* be preserved.

 Rat Genome Sequencing Consortium.
 Direct Submission
 Submitted (10-MAY-2003) Human Genome Sequencing Center, Department
 of Molecular and Human Genetics, Baylor College of Medicine, One
 Baylor Plaza, Houston, TX 77030, USA
 On May 10, 2003 this sequence version replaced gi:23664494.
 The sequence in this assembly is a combination of BAC based reads
 and whole genome shotgun sequencing reads assembled using Atlas
 (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
 in the feature table below represents a scaffold in the Atlas
 assembly (a 'contig-scaffold'). Within each contig-scaffold,
 individual sequence contigs are ordered and oriented, and separated
 by sized gaps filled with Ns to the estimated size. The sequence
 may extend beyond the ends of the clone and there may be sequence
 contigs within a contig-scaffold that consist entirely of whole
 genome shotgun sequence reads. Both end sequences and whole genome
 shotgun sequence only contigs will be indicated in the feature
 table.

 Center clone name: CH230-132K18
 ----- Summary Statistics
 Assembly program: Atlas 3.0
 Consensus quality: 218983 bases at least Q40
 Consensus quality: 220425 bases at least Q30

Consensus quality: 221525 bases at least Q20
 Estimated insert size: 229249; sum-of-contigs estimation
 Quality coverage: 7x in Q20 bases; sum-of-contigs estimation

 * NOTE: Estimated insert size may differ from sequence length
 (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
 * NOTE: This is a 'working draft' sequence. It currently
 consists of 2 contigs. The true order of the pieces
 is not known and their order in this sequence record is
 arbitrary. Gaps between the contigs are represented as
 runs of N, but the exact sizes of the gaps are unknown.
 * This record will be updated with the finished sequence
 as soon as it is available and the accession number will
 be preserved.

* 1 220835: contig of 220835 bp in length
 * 220836 220935: gap of unknown length
 * 220936 222692: contig of 1757 bp in length.

Project Information

Center project name: GLK8

Center clone name: CH230-20206

Summary Statistics

Assembly program: Atlas 3.0;

Consensus quality: 215513 bases at least Q40

Consensus quality: 218526 bases at least Q30

Consensus quality: 220428 bases at least Q20

Estimated insert size: 232032; sum-of-contigs estimation
Quality coverage: 6x in Q20 bases; sum-of-contigs estimation

* NOTE: Estimated insert size may differ from sequence length
(see http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html).
* NOTE: This is a 'working draft' sequence. It currently
consists of 6 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
as soon as it is available and the accession number will
be preserved.

Rat Genome Sequencing Consortium.
Direct Submission
Submitted (22-SEP-2002) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
On Sep 19, 2002 this sequence version replaced gi:21908887.
The sequence in this assembly is a combination of BAC based reads
and whole genome shotgun sequencing reads assembled using Atlas
(<http://www.hgsc.bcm.tmc.edu/projects/rat/>). As a result, the
sequence may extend beyond the ends of the clone and there may be
contigs that consist entirely of whole genome shotgun sequence
reads. Both end sequences and whole genome shotgun sequence only
contigs will be indicated in the feature table.

 through the I.M.A.G.E. Consortium/LLNL at: <http://image.llnl.gov>
 Series: IRAK Plate: 186 Row: 0 Column: 24

This clone was selected for full length sequencing because it
 passed the following selection criteria: matched mRNA gi: 13929143.

e-mail for correspondence: arabsequence.stanford.edu

Genes with similarity to proteins in the databases are described as 'putative', '-like' or 'similar to'. Genes that have EST similarity but no significant protein similarity are described as 'unknown proteins'. Genes that are annotated based only on gene prediction software are described as 'hypothetical proteins'. The software programs used to predict genes include: Grail (Informatics Group, Oak Ridge National Laboratory, <http://compbio.ornl.gov/section/index.html>), GENSCAN (Chris Burge, <http://genomics.stanford.edu/~chris/GENSCANW.html>), Fexa (V.Solovyev & A.Salamov, Sanger Centre, <http://genomic.sanger.ac.uk/>), and NetPlantGene (S.M. Hebsgaard, et al., CBS, Technical University of Denmark, <http://www.cbs.dtu.dk/NetPlantGene.html>).

Center: Washington University Genome Sequencing Center
Center code: WUGSC
Web site: http://genome.wustl.edu
Contact: submissions@watson.wustl.edu
----- Summary Statistics
Center project name: M_BB0511A23
Drafting center: WIBR

NOTICE:
This sequence was finished as follows unless otherwise noted:
all regions were double stranded, sequenced with an alternate
chemistry, or covered by high quality data (i.e. phred quality
>=30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone, fosmid clone or direct clone walk sequence.
Sequence from the Mouse Genome Sequencing Consortium whole genome
shotgun may have been used to obtain the consensus sequence. The
assembly was confirmed by restriction digest.
This finishing standard has slightly changed from the previous
Human standard. Specifically, standards for regions of low sequence
complexity (such as dinucleotide repeats and small unit tandem
repeats) have been relaxed. These regions are very prevalent in the
mouse genome, and the return on extended finishing efforts is
minimal.
If a sequence meets the criteria of the above statement, it needs
no comments or tags. If the criteria are not met, such as ambiguous
bases, then the region is duly annotated.

MAPPING INFORMATION:
Mapping information for this clone was provided by Dr. Wes Warren,
Department of Genetics, Washington University, St. Louis MO. For
additional information about the map position of this sequence, see
http://genome.wustl.edu

SOURCE INFORMATION:
The BAC Library has been constructed by Pieter de Jong and
coworkers (http://www.chori.org) from male C57Bl/6J mouse spleen
and/or brain genomic DNA. The clone and detailed information can be
obtained from Pieter de Jong and coworkers at http://www.chori.org

This sequence is the entire insert of the clone.

 XX Inhibiting a cancerous phenotype of a cell, useful for treating breast
 PT cancer comprises contacting a cancerous mammalian cell with an agent for
 PT inhibition of DKFZp561133 activity.
 XX
 XX Claim 30; SEQ ID NO 47; 257pp; English.
 XX
 XX The invention relates to a method of inhibiting a cancerous phenotype of
 CC a cell comprises contacting a cancerous mammalian cell with an agent for
 CC inhibition of DKFZp561133 activity. The methods are useful for treating
 CC cancer, e.g. breast cancer. This sequence represents a gene product which
 CC is differentially expressed in breast cancer cells. The sequence can be
 CC used in the method of the invention.

 XX A method, useful for prognosing and treating solid tumor, comprises
 PT comparing an expression profile of a gene expressed in peripheral blood
 PT mononuclear cells to a reference expression profile of a gene.
 PT
 XX Disclosure; Page; 111pp; English.
 PS
 XX The invention describes a method comprising comparing an expression
 CC profile of at least one gene in a peripheral blood sample of a patient to
 CC at least one reference expression profile of the at least one gene, where
 CC the patient has a solid tumour, and each of the gene is differentially

CC expressed in peripheral blood mononuclear cells (PBMCs) of a first class
 CC of patients as compared to PBMCs of a second class of patients, where
 CC both the first and second classes of patients have the solid tumour, and
 CC each of the first and second classes is a subcluster formed by an
 CC unsupervised clustering analysis of gene expression profiles in PBMCs of
 CC a population of patients who have the solid tumour, and where the
 CC majority of the first class of patients has a first clinical outcome, and
 CC the majority of the second class of patients has a second clinical
 CC outcome. Also described are: a system comprising (i) a memory or a
 CC storage medium including data that represent an expression profile of at
 CC least one gene in a peripheral blood sample of a patient who has a solid
 CC tumour, (ii) at least another storage medium including data that
 CC represent at least one reference expression profile of the gene, (iii) a
 CC program capable of comparing the expression profile to the reference
 CC expression profile, and (iv) a processor capable of executing the
 CC program, where expression levels of the gene in peripheral blood
 CC mononuclear cells of patients who have the solid tumour correlate with
 CC clinical outcomes of the patients; and a nucleic acid or protein array
 CC comprising concentrated probes for solid tumour prognosis genes, where
 CC each of the solid tumour prognosis genes is differentially expressed in
 CC PBMCs of a first class of patients as compared to PBMCs of a second class
 CC of patients, where both the first and second classes of patients have a
 CC solid tumour, and where the first class of patients has a first clinical
 CC outcome, and the second class of patients has a second clinical outcome.
 CC The method, system, and array are useful for prognosing and treating
 CC solid tumours. This sequence represents a solid tumour prognosis gene of
 CC the invention. Note: The sequence data for this patent did not form part
 CC of the printed specification, but was obtained in electronic format
 CC directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

 Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
 response useful in vaccinating against and in treating tumors.
 Disclosure; Page 78-79; 79pp; English.
 The present sequence encodes the canine 5T4 tumour-associated antigen
 (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in

CC carcinomas but has a highly restricted expression pattern in normal adult
 tissues. It appears to be strongly correlated to metastasis in colorectal
 and gastric cancer. 5T4 antigen may therefore be useful in tumour
 diagnosis, targeting and immunotherapy. Mice in which tumours had been
 induced were inoculated with a virus expression vector containing the
 human or murine 5T4 gene sequence. The 5T4 antigen was shown to be
 effective at eliciting an immunotherapeutic anti-tumour response. Both
 the nucleic acid encoding the antigen and the antigen itself can be used
 to elicit an immune response, preferably CTL or an antibody response in a
 subject

 XX PT Detecting a breast cancer-associated transcript in a patient's cell,
 PT useful for diagnosing breast cancer, comprises contacting a biological
 PT sample with a polynucleotide that selectively hybridizes with breast
 PT cancer nucleic acids.
 XX Claim 9; Page 372; 414pp; English.
 XX The invention comprises a method of detecting a breast cancer-associated
 CC transcript in a cell from a patient. The method of the invention involves
 CC contacting a biological sample from the patient with a nucleotide that
 CC hybridizes to one of the 69 breast cancer-associated gene sequences shown

CC in the specification. The method of the invention is useful in the
 CC diagnosis or prognosis of breast cancer, and for detecting genes that are
 CC up or down-regulated in breast cancer cells. Genes identified by the
 CC method of the invention can be used in diagnostic purposes and also as
 CC targets for screening for therapeutic compounds that modulate breast
 CC cancer (e.g. hormones or antibodies). Identification of genes that are
 CC over or under expressed in breast cancer can additionally provide high-
 CC resolution, high-sensitivity datasets which can be used in the areas of
 CC diagnostics, therapeutics, drug development, pharmacogenetics, protein
 CC structure and biosensor development. DNA sequences ABT07693 - ABT07761
 CC represent the 69 breast cancer-associated gene sequences of the invention

XX Detecting a lung cancer-associated transcript in a cell from a patient
 PT for treating lung cancer, by contacting a biological sample from the
 PT patient with a polynucleotide that exhibits increased or decreased
 PT expression in lung cancer.

XX Claim 22; Page 336; 453pp; English.

CC The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridises
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

PT Detecting an ovarian cancer-associated transcript in a cell from a
PT patient, comprises contacting a biological sample from the patient with a
PT polynucleotide that hybridizes to an ovarian cancer gene.
XX
PS Claim 10; Page 297; 332pp; English.
XX
CC The invention relates to a method of detecting an ovarian cancer-
CC associated transcript in a cell from a patient, by contacting a
CC biological sample from the patient with a polynucleotide that selectively
CC hybridizes to a sequence at least 80% identical to any of one of 80
CC nucleic acid sequences given in the specification. The method is useful
CC in diagnosing ovarian cancer and in identifying and using agents and/or
CC targets that inhibit ovarian cancer. The nucleic acid molecule,
CC polypeptide and the antibody may also be used in detecting ovarian
CC cancers, monitoring and early detection of relapse following treatment,
CC monitoring response to therapy, selecting patients for post-operative
CC chemotherapy or radiation therapy, in selecting mode of therapy,
CC determining tumour prognosis, early detection of pre-cancerous lesions,
CC and as vaccines. This sequence corresponds to one of the nucleic acids
CC used for the detection method of the invention.

 XX
 XX New NOVX polypeptides and polynucleotides, useful for preventing,
 PT diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer,
 PT Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic
 PT disorders, and asthma.
 XX
 XX Claim 16; Page 114-115; 619pp; English.
 PS
 XX The present invention relates to new isolated proteins (NOVX) and their
 CC coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is
 CC any number from 1 to 48. The NOVX proteins and coding sequences are
 CC useful in the manufacture of a medicament for treating a syndrome
 CC associated with a human disease, preferably a NOVX-associated disorder.
 CC The NOVX coding sequences and proteins are useful for treating,
 CC preventing or diagnosing diseases such as metabolic disorders, diabetes,
 CC obesity, infectious disease, anorexia, cancer-associated cachexia,
 CC cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's
 CC disease, immune disorders, hematopoietic disorders, cardiovascular
 CC disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic
 CC disturbances associated with obesity, metabolic syndrome X or wasting
 CC disorders associated with chronic diseases or various cancers. The NOVX
 CC coding sequences and proteins may also be used as targets for the
 CC identification of small molecules that modulate or inhibit e.g.
 CC neurogenesis, cell differentiation, cell proliferation, hematopoiesis,
 CC wound healing and angiogenesis, in gene therapy, in generation of
 CC antibodies that bind immunospecifically to NOVX substructures for use in
 CC therapeutic or diagnostic methods

 XX
 XX Novel canine or feline 5T4 polypeptide and polynucleotides encoding the
 PT polypeptide, useful in preparation of vaccine for treating and/or
 PT preventing cancer in a subject, preferably a dog or cat.
 PS
 XX Claim 4; Page 68; 68pp; English.
 XX The present invention relates to the isolation of canine and feline
 CC oncofoetal leucine-rich glycoproteins known as 5T4, and the
 CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in
 CC a significant proportion of tumours. The sequences of the invention are
 CC useful in a pharmaceutical composition for the prevention and/or
 CC treatment of tumours or other diseases associated with cell
 CC proliferation, infections, and inflammatory conditions in animals,
 CC preferably dogs or cats. The compositions may also be used for cancer
 CC immunotherapy in these animals. The sequences of the invention may also
 CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
 CC measurement and localisation of 5T4 in extracts of plasma, urine,
 CC tissues, and in cell culture media. Antibodies specific for the 5T4
 CC protein are useful for isolating foetal cells from maternal blood. The
 CC isolation process may form part of a diagnostic method e.g. the foetal
 CC cells may then be subject to biochemical or genetic sampling used for
 CC testing foetal abnormalities, or to determine the sex of the foetus(es).
 CC The present sequence encodes feline 5T4 protein

XX PT Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
XX response useful in vaccinating against and in treating tumors.
XX PS Example 2; Page 78; 79pp; English.
XX CC The present sequence encodes the human 5T4 tumour-associated antigen
XX (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
XX CC carcinomas but has a highly restricted expression pattern in normal adult
XX CC tissues. It appears to be strongly correlated to metastasis in colorectal
XX CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
XX CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
XX CC induced were inoculated with a virus expression vector containing the
XX CC present sequence. The 5T4 antigen was shown to be effective at eliciting
XX CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
XX CC the antigen and the antigen itself can be used to elicit an immune
XX CC response, preferably CTL or an antibody response in a subject

XX PT Use of single chain antibody capable of recognizing a disease associated
XX molecule for manufacturing a medicament for preventing and/or treating a
XX disease condition associated with disease associated molecule.
XX PS Disclosure; Fig 26; 118pp; English.
XX CC The specification describes the use of a single chain antibody (ScFv),
XX CC which is capable of recognizing a disease associated molecule in the
XX CC manufacture of a medicament for the prevention and treatment of a disease
XX CC condition. The ScFv antibody is useful in the manufacture of a
XX CC medicament, for affecting a disease in vivo, for preparing a
XX CC pharmaceutical composition, for in vivo imaging and/or for adjuvant
XX CC treatment of a disease. The ScFv antibody is also useful for treating
XX CC inflammatory diseases including arthritis, hypersensitivity, autoimmune
XX CC diseases, cancers, central nervous system disorders including Parkinson's
XX CC disease, periodontal diseases, cardiopulmonary diseases, cardiovascular
XX CC diseases, gastrointestinal disorders, infections, diabetes, Helicobacter-
XX CC related diseases, and other immune disorders. The present sequence
XX CC encodes a 5T4 protein, which is used to produce ScFv of the invention

XX
DR New oligonucleotide libraries comprising oligonucleotides which
PT selectively hybridize to mRNAs transcribed from a transcription unit of a
PT genome, useful for detecting tissue-, pathology-, and developmental-
PT specific genes.
XX
XX Example 1; SEQ ID NO 29022; 47pp; English.
XX
CC The present invention describes oligonucleotide libraries for detecting
CC messenger RNAs that populate a (sub-)transcriptome, where the (sub-
CC )transcriptome comprises messenger RNAs transcribed from multiple
CC transcription units that populate a genome. The library comprises several
CC oligonucleotides, each capable of hybridising selectively to a set of
CC messenger RNAs transcribed from a given transcription unit of the genome,
CC which encodes one or more messenger RNA splice variants. The
CC oligonucleotide libraries are useful for detecting mRNAs from a
CC biological sample, in expression profiling studies, in qualitatively or
CC quantitatively characterising the corresponding transcriptome, and in
CC detecting RNA transcripts and splice variants of human or animal
CC transcriptomes. The libraries may also be used as specialised mini
CC libraries to detect transcripts of a sub-transcriptome under a particular
CC biological or pathological state, and so allowing the detection of tissue
CC - and pathology-specific genes such as those genes only expressed in
CC specific tissue under a specific pathological condition; to detect
CC developmental specific genes; and to detect RNA transcripts and splice
CC variants of a transcriptome of a patient suffering from a particular
CC disorder. ABN27253 to ABN59589 represent oligonucleotide sequences from
CC rats, humans and mice, which are used in the exemplification of the
CC present invention. N.B. The sequence data for this patent did not form
CC part of the printed specification, but was obtained in electronic format
CC directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

XX
PT Determining open reading frames of genome of an organism e.g. a human
PT suffering from cancer involves use of single oligonucleotide primer at
PT low stringency for preparing single-stranded cDNA from mRNA of
PT individual.
XX
XX Example 9; Page 866; 959pp; English.
XX
CC The invention describes a method of determining open reading frames in
CC the genome of organism, comprising contacting mRNA from cell of organism
CC with a single oligonucleotide primer (I) at low stringency, preparing
CC single-stranded cDNA by reverse transcribing mRNA with (I), amplifying
CC cDNA, sequencing the product, and repeating the contacting, preparing
CC and amplifying steps with different primers and sequencing resulting
CC nucleic acids. The method is useful for: determining that a known
CC nucleotide sequence from a genome of an organism corresponds to a
CC nucleotide sequence of an open reading frame; for preparing a contig.
CC nucleic acid molecule from a genome of an organism; and for sequencing
CC all or part of a genome of an organism. mRNA is obtained from mammalian
CC or human cell which is associated with a pathological condition e.g. a
CC colon cancer or breast cancer cell. The method is useful for analyses of
CC populations of subjects and can be used to carry out genetic analyses of
CC large or small populations. further, it can be used to study living
CC systems to determine if, e.g. there have been genetic shifts which render
CC an individual or population more or less likely to be afflicted with
CC diseases such as cancer, to determine antibiotic resistance or non-
CC tolerance, and so forth. The method can also be used in the study of
CC congenital diseases, and the risk of affliction to a foetus, as well as
CC the study of whether the conditions are likely to be passed to offspring
CC through ova or sperm. The analyses for pathological conditions can be
CC carried out in all animals, plants, birds, fish, etc. Using this method,
CC in the area of agriculture, for example the genomes of food crops can be
CC studied to determine if resistance genes are present, defects in plant
CC genomes can also be studied in this way. Similarly, the method permits
CC determination of the pathogens which integrate into the genome, such as
CC retroviruses and other integrating viruses such as influenza virus, have
CC undergone shifts or mutations, which may require different approaches to
CC therapy. This method is also applied to eukaryotic pathogens, such as
CC trypanosomes, different types of Plasmodium, etc. The method essentially
CC eliminates sequencing of non-coding portions. This sequence represents a
CC polynucleotide isolated from human colon cancer cell cDNA library

 PT New isolated polynucleotide and encoded polypeptides, useful in
 PT diagnostics, forensics, gene mapping, identification of mutations
 PT responsible for genetic disorders or other traits and to assess
 PT biodiversity.
 XX
 PS Claim 1; SEQ ID NO 22978; 103pp; English.
 XX
 CC The invention relates to isolated polynucleotide (I) and polypeptide (II)
 CC sequences. (I) is useful as hybridisation probes, polymerase chain
 CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
 CC and in recombinant production of (II). The polynucleotides are also used
 CC in diagnostics as expressed sequence tags for identifying expressed
 CC genes. (I) is useful in gene therapy techniques to restore normal
 CC activity of (II) or to treat disease states involving (II). (II) is
 CC useful for generating antibodies against it, detecting or quantitating a
 CC polypeptide in tissue, as molecular weight markers and as a food
 CC supplement. (II) and its binding partners are useful in medical imaging
 CC of sites expressing (II). (I) and (II) are useful for treating disorders
 CC involving aberrant protein expression or biological activity. The
 CC polypeptide and polynucleotide sequences have applications in
 CC diagnostics, forensics, gene mapping, identification of mutations
 CC responsible for genetic disorders or other traits to assess biodiversity
 CC and to produce other types of data and products dependent on DNA and
 CC amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
 CC coding sequences of the invention. Note: The sequence data for this
 CC patent did not appear in the printed specification, but was obtained in
 CC electronic format directly from WIPO at
 CC ftp.wipo.int/pub/published_pct_sequences

 XX A method, useful for prognosing and treating solid tumor, comprises
 PT comparing an expression profile of a gene expressed in peripheral blood
 PT mononuclear cells to a reference expression profile of a gene.
 PT
 PS Disclosure; Page; 111pp; English.
 XX
 CC The invention describes a method comprising comparing an expression
 CC profile of at least one gene in a peripheral blood sample of a patient to
 CC at least one reference expression profile of the at least one gene, where
 CC the patient has a solid tumour, and each of the gene is differentially
 CC expressed in peripheral blood mononuclear cells (PBMCs) of a first class
 CC of patients as compared to PBMCs of a second class of patients, where
 CC both the first and second classes of patients have the solid tumour, and
 CC each of the first and second classes is a subcluster formed by an
 CC unsupervised clustering analysis of gene expression profiles in PBMCs of
 CC a population of patients who have the solid tumour, and where the
 CC majority of the first class of patients has a first clinical outcome, and
 CC the majority of the second class of patients has a second clinical
 CC outcome. Also described are: a system comprising (i) a memory or a
 CC storage medium including data that represent an expression profile of at
 CC least one gene in a peripheral blood sample of a patient who has a solid
 CC tumour, (ii) at least another storage medium including data that
 CC represent at least one reference expression profile of the gene, (iii) a
 CC program capable of comparing the expression profile to the reference
 CC expression profile, and (iv) a processor capable of executing the
 CC program, where expression levels of the gene in peripheral blood
 CC mononuclear cells of patients who have the solid tumour correlate with
 CC clinical outcomes of the patients; and a nucleic acid or protein array
 CC comprising concentrated probes for solid tumour prognosis genes, where
 CC each of the solid tumour prognosis genes is differentially expressed in
 CC PBMCs of a first class of patients as compared to PBMCs of a second class
 CC of patients, where both the first and second classes of patients have a
 CC solid tumour, and where the first class of patients has a first clinical
 CC outcome, and the second class of patients has a second clinical outcome.
 CC The method, system, and array are useful for prognosing and treating
 CC solid tumours. This sequence represents a solid tumour prognosis gene of
 CC the invention. Note: The sequence data for this patent did not form part
 CC of the printed specification, but was obtained in electronic format
 CC directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

XX Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
XX response useful in vaccinating against and in treating tumors.
XX Disclosure; Page 78-79; 79pp; English.
XX The present sequence encodes the canine 5T4 tumour-associated antigen
XX (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
XX carcinomas but has a highly restricted expression pattern in normal adult
XX tissues. It appears to be strongly correlated to metastasis in colorectal
XX and gastric cancer. 5T4 antigen may therefore be useful in tumour
XX diagnosis, targeting and immunotherapy. Mice in which tumours had been
XX induced were inoculated with a virus expression vector containing the
XX human or murine 5T4 gene sequence. The 5T4 antigen was shown to be
XX effective at eliciting an immunotherapeutic anti-tumour response. Both
XX the nucleic acid encoding the antigen and the antigen itself can be used
XX to elicit an immune response, preferably CTL or an antibody response in a
XX subject

 PT Detecting an ovarian cancer-associated transcript in a cell from a
 PT patient, comprises contacting a biological sample from the patient with a
 PT polynucleotide that hybridizes to an ovarian cancer gene.
 XX
 PS Claim 10; Page 297; 332pp; English.
 XX
 CC The invention relates to a method of detecting an ovarian cancer-
 CC associated transcript in a cell from a patient, by contacting a
 CC biological sample from the patient with a polynucleotide that selectively
 CC hybridizes to a sequence at least 80% identical to any of one of 80
 CC nucleic acid sequences given in the specification. The method is useful
 CC in diagnosing ovarian cancer and in identifying and using agents and/or
 CC targets that inhibit ovarian cancer. The nucleic acid molecule,
 CC polypeptide and the antibody may also be used in detecting ovarian
 CC cancers, monitoring and early detection of relapse following treatment,
 CC monitoring response to therapy, selecting patients for post-operative
 CC chemotherapy or radiation therapy, in selecting mode of therapy,
 CC determining tumour prognosis, early detection of pre-cancerous lesions,
 CC and as vaccines. This sequence corresponds to one of the nucleic acids
 CC used for the detection method of the invention.

 PT Determining the presence or absence of a pathological cell in a patient,
 PT useful for diagnosing, prognosing or treating cancer, comprises detecting
 PT a nucleic acid in a biological sample.
 XX
 PS Claim 8; SEQ ID NO 41; 1385pp; English.
 XX
 CC The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
 CC whose expression is upregulated or downregulated in specific cancers or
 CC other diseases such as angiogenic or fibrotic disorders, and to methods
 CC of determining the presence or absence of a pathological cell in a
 CC patient by detecting a nucleic acid at least 80% identical to those of
 CC the invention or by detecting a polypeptide of the invention. The
 CC invention also relates to expression vectors and host cells comprising a

CC nucleic acid of the invention; antibodies which specifically bind a
CC polypeptide of the invention; use of such antibodies for drug targeting;
CC and methods of screening for modulators of activity or expression of the
CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
CC antibodies and methods are useful for diagnosing, prognosing and treating
CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
CC neovascularisation syndromes, scarring and uterine fibroids. They may
CC also be useful in wound healing and in contraception. The present
CC sequence represents a nucleic acid sequence of the invention.

 New NOVX polypeptides and polynucleotides, useful for preventing,
 diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer,
 Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic
 disorders, and asthma.
 Claim 16; Page 114-115; 619pp; English.
 The present invention relates to new isolated proteins (NOVX) and their
 coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is
 any number from 1 to 48. The NOVX proteins and coding sequences are
 useful in the manufacture of a medicament for treating a syndrome
 associated with a human disease, preferably a NOVX-associated disorder.
 The NOVX coding sequences and proteins are useful for treating,
 preventing or diagnosing diseases such as metabolic disorders, diabetes,
 obesity, infectious disease, anorexia, cancer-associated cachexia,
 cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's
 disease, immune disorders, haematopoietic disorders, cardiovascular
 disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic
 disturbances associated with obesity, metabolic syndrome X or wasting
 disorders associated with chronic diseases or various cancers. The NOVX
 coding sequences and proteins may also be used as targets for the
 identification of small molecules that modulate or inhibit e.g.

CC neurogenesis, cell differentiation, cell proliferation, haematopoiesis,
 CC wound healing and angiogenesis, in gene therapy, in generation of
 CC antibodies that bind immunospecifically to NOVX substances for use in
 CC therapeutic or diagnostic methods

PT Novel canine or feline 5T4 polypeptide and polynucleotides encoding the
 PT polypeptide, useful in preparation of vaccine for treating and/or
 PT preventing cancer in a subject, preferably a dog or cat.

PS Claim 4; Page 68; 68pp; English.

XX The present invention relates to the isolation of canine and feline
 CC oncofetal leucine-rich glycoproteins known as 5T4, and the
 CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in
 CC a significant proportion of tumours. The sequences of the invention are
 CC useful in a pharmaceutical composition for the prevention and/or
 CC treatment of tumours or other diseases associated with cell
 CC proliferation, infections, and inflammatory conditions in animals,
 CC preferably dogs or cats. The compositions may also be used for cancer
 CC immunotherapy in these animals. The sequences of the invention may also

CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
 CC measurement and localisation of 5T4 in extracts of plasma, urine,
 CC tissues, and in cell culture media. Antibodies specific for the 5T4
 CC protein are useful for isolating foetal cells from maternal blood. The
 CC isolation process may form part of a diagnostic method e.g. the foetal
 CC cells may then be subject to biochemical or genetic sampling used for
 CC testing foetal abnormalities, or to determine the sex of the foetus(es).
 CC The present sequence encodes feline 5T4 protein

XX New major histocompatibility complex class I peptide epitopes from human
 PT 5T4 tumor-associated antigen, useful for preventing and/or treating a
 PT disease, particularly cancer.

XX Disclosure; Page 67; 73pp; English.

XX The invention relates to a novel Major Histocompatibility Complex (MHC)
 CC class I peptide epitope of the 5T4 antigen. The invention further
 CC provides a polypeptide string comprising the 5T4 epitope; a nucleic acid
 CC sequence encoding the 5T4 epitope or a polypeptide string of the 5T4
 CC epitope; a vector system capable of delivering the 5T4 epitope nucleic
 CC acid to a cell; a cell pulsed with the 5T4 epitope, a polypeptide of the

CC 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine
 CC comprising the above; a method for treating and/or preventing a disease
 CC in a subject by administering the vaccine; an agent capable of binding
 CC specifically to the 5T4 epitope and/or its encoding nucleic acid; a method
 CC comprising detecting the presence of the 5T4 epitope or its encoding
 CC nucleic acid in a subject; and a T cell line or clone capable of
 CC specifically recognising the 5T4 epitope in conjunction with an MHC class
 CC I molecule. The 5T4 epitope has cytostatic activity. The vaccine
 CC comprising the 5T4 epitope or its encoding nucleic acid and the vector
 CC system or cell is useful in the prevention and/or treatment of a disease,
 CC particularly cancer. The detection method is useful for diagnosing or
 CC monitoring the progression of a cancerous disease, and for detecting the
 CC presence of the 5T4 epitope or its nucleic acid. The T cell line or clone
 CC is useful in the manufacture of a medicament for treating and/or
 CC preventing a disease. This polynucleotide sequence represents the feline
 CC 5T4 antigen coding DNA of the invention.

XX New Major Histocompatibility Complex class II peptide epitope of 5T4,
 PT useful for manufacturing a medicament for diagnosing, preventing and/or
 PT treating a disease, e.g. cancer.

XX Disclosure; Page 49; 63pp; English.

XX The invention relates to a Major Histocompatibility Complex (MHC) class
CC II peptide epitope of the 5T4 antigen. The vaccine or T-cell line or
CC clone has a cytostatic activity, as it is useful in manufacturing a
CC medicament for preventing and/or treating a disease, particularly cancer.
CC The methods are useful for detecting T-cells capable of specifically
CC recognising a peptide epitope in conjunction with an MHC molecule, for
CC diagnosing or monitoring the progression of a cancerous disease, or for
CC detecting the presence of a peptide or nucleic acid using an agent. The
CC MHC class II peptide epitope of the invention can be used in gene therapy
CC or as part of a vaccine. This polynucleotide sequence represents the DNA
CC coding for the feline 5T4 protein.

XX Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
XX response useful in vaccinating against and in treating tumors.

XX Example 2; Page 78; 79pp; English.

XX The present sequence encodes the human 5T4 tumour-associated antigen
XX (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
XX carcinomas but has a highly restricted expression pattern in normal adult
XX tissues. It appears to be strongly correlated to metastasis in colorectal
XX and gastric cancer. 5T4 antigen may therefore be useful in tumour
XX diagnosis, targeting and immunotherapy. Mice in which tumours had been
XX induced were inoculated with a virus expression vector containing the

CC present sequence. The 5T4 antigen was shown to be effective at eliciting
CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
CC the antigen and the antigen itself can be used to elicit an immune
CC response, preferably CTL or an antibody response in a subject

XX Carroll MW, Myers KA;
 XX WPI; 2000-387735/33.
 XX
 PT Tumor associated antigen, ST4 capable of eliciting cytotoxic T-lymphocyte
 PT response useful in vaccinating against and in treating tumours.
 XX
 PS Example 2; Page 78; 79pp; English.
 XX
 CC The present sequence encodes the mouse ST4 tumour-associated antigen
 CC (TAA). The TAA ST4 is a glycoprotein which is widely expressed in
 CC carcinomas but has a highly restricted expression pattern in normal adult
 CC tissues. It appears to be strongly correlated to metastasis in colorectal
 CC and gastric cancer. ST4 antigen may therefore be useful in tumour
 CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
 CC induced were inoculated with a virus expression vector containing the
 CC present sequence. The ST4 antigen was shown to be effective at eliciting
 CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
 CC the antigen and the antigen itself can be used to elicit an immune
 CC response, preferably CTL or an antibody response in a subject. The
 CC present sequence appears in GenBank at accession number AJ012160

 XX
 PS Claim 4; SEQ ID NO 125; 1368pp; English.
 XX
 CC The invention relates to a purified protein promoting signal transducer
 CC and activator of transcription 6 activation (STAT6). The protein is
 CC useful for the producing an antibody, which involves administering the
 CC protein or its epitope-bearing fragments to a non-human animal as an
 CC antigen. The nucleic acid is useful for diagnosing a disease or
 CC susceptibility to a disease related to expression or activity of the
 CC protein. A transformant expressing the protein is useful for screening
 CC compounds which inhibit or promote STAT6 activation. A transformant
 CC expressing the protein is useful for producing a pharmaceutical
 CC composition. Compositions, antibodies and antisense molecules are useful
 CC for the treating a disease associated with STAT6 activation such as
 CC allergic diseases, inflammation, autoimmune diseases, diabetes,
 CC hyperlipidaemia, infectious disease and cancers. Compositions are useful
 CC for treating disease associated with STAT6 activation and/or prevention
 CC of Th1 hyperactive diseases. Compositions are also useful in rheumatoid
 CC arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,
 CC allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,
 CC viral hepatitis and AIDS. The protein has efficient promoting STAT6
 CC activity. The protein or nucleic acid is effectively useful for screening
 CC compounds for treating and preventing disease associated with excessive
 CC activation or inhibition of STAT6. The present sequence represents a
 CC human cDNA encoding a protein which promotes STAT6 activation.

 XX Novel canine or feline 5T4 polypeptide and polynucleotides encoding the
 PT polypeptide, useful in preparation of vaccine for treating and/or
 PT preventing cancer in a subject, preferably a dog or cat.
 XX Claim 4; Page 68; 68pp; English.
 XX The present invention relates to the isolation of canine and feline
 CC oncofoetal leucine-rich glycoproteins known as 5T4, and the
 CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in
 CC a significant proportion of tumours. The sequences of the invention are
 CC useful in a pharmaceutical composition for the prevention and/or
 CC treatment of tumours or other diseases associated with cell
 CC proliferation, infections, and inflammatory conditions in animals,
 CC preferably dogs or cats. The compositions may also be used for cancer
 CC immunotherapy in these animals. The sequences of the invention may also
 CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
 CC measurement and localisation of 5T4 in extracts of plasma, urine,
 CC tissues, and in cell culture media. Antibodies specific for the 5T4
 CC protein are useful for isolating foetal cells from maternal blood. The
 CC isolation process may form part of a diagnostic method e.g. the foetal
 CC cells may then be subject to biochemical or genetic sampling used for
 CC testing foetal abnormalities, or to determine the sex of the foetus(es).
 CC The present sequence encodes feline 5T4 protein

New major histocompatibility complex class I peptide epitopes from human 5T4 tumor-associated antigen, useful for preventing and/or treating a disease, particularly cancer.
Disclosure; Page 67; 73pp; English.
The invention relates to a novel Major Histocompatibility Complex (MHC) class I peptide epitope of the 5T4 antigen. The invention further provides a polypeptide string comprising the 5T4 epitope; a nucleic acid sequence encoding the 5T4 epitope or a polypeptide string of the 5T4 epitope; a vector system capable of delivering the 5T4 epitope nucleic acid to a cell; a cell pulsed with the 5T4 epitope, a polypeptide of the 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine comprising the above; a method for treating and/or preventing a disease in a subject by administering the vaccine; an agent capable of binding specifically to the 5T4 epitope and/or its encoding nucleic acid; a method comprising detecting the presence of the 5T4 epitope or its encoding nucleic acid in a subject; and a T cell line or clone capable of specifically recognising the 5T4 epitope in conjunction with an MHC class I molecule. The 5T4 epitope has cytostatic activity. The vaccine comprising the 5T4 epitope or its encoding nucleic acid and the vector particularly cancer. The detection method is useful for diagnosing or monitoring the progression of a cancerous disease, and for detecting the presence of the 5T4 epitope or its nucleic acid. The T cell line or clone is useful in the manufacture of a medicament for treating and/or preventing a disease. This polynucleotide sequence represents the feline 5T4 antigen coding DNA of the invention.

New Major Histocompatibility Complex class II peptide epitope of 5T4, useful for manufacturing a medicament for diagnosing, preventing and/or treating a disease, e.g. cancer.
Disclosure; Page 49; 63pp; English.
The invention relates to a Major Histocompatibility Complex (MHC) class II peptide epitope of the 5T4 antigen. The vaccine or T-cell line or clone has a cytostatic activity, as it is useful in manufacturing a medicament for preventing and/or treating a disease, particularly cancer. The methods are useful for detecting T-cells capable of specifically recognising a peptide epitope in conjunction with an MHC molecule, for diagnosing or monitoring the progression of a cancerous disease, or for detecting the presence of a peptide or nucleic acid using an agent. The MHC class II peptide epitope of the invention can be used in gene therapy or as part of a vaccine. This polynucleotide sequence represents the DNA coding for the feline 5T4 protein.

XX Claim 1; SEQ ID NO 7963; 41pp; English.
PS
XX
XX This invention is related to a novel isolated canine nucleic acid
CC sequences and the construction of canine microarrays containing a
CC significant portion of the canine genome. The isolated canine nucleic
CC acid sequences of the invention may be useful for drug screening and
CC toxicity assays. The invention is therefore useful for assessing the
CC impact, including toxicity, of a compound, pharmaceutical agent or
CC environmental pollutant on a cell or living organism. The methods are
CC useful for detecting genes that are up- or down-regulated in canines in a
CC disease state. The sequences are useful as diagnostic agents or markers
CC to detect a cellular response in a sample individually or as part of a
CC gene expression profile. It is also useful as a target for agents that
CC modulate gene expression or activity. The database is useful for
CC producing electronic Northern blots that allow the user to determine the cell
CC type or tissue in which a given gene is expressed and to allow
CC determination of the abundance or expression level of a given gene in a
CC particular tissue or cell. The methods are useful for determining the
CC similarity of a toxic response to one or more individual compounds. The
CC methods are useful for predicting at least one toxic response or the
CC likelihood that a compound or test agent will induce various specific
CC pathologies such as those of the liver (liver necrosis, fatty liver
CC disease, protein adduct formation or hepatitis), those of the kidney,
CC heart, brain or testes, or other pathologies associated with at least one
CC of the toxins. The methods are also useful for predicting or elucidating
CC the potential cellular pathways influenced, induced or modulated by the
CC compound or test agent due to the similarity of the expression profile
CC compared to the profile induced by a known toxin. The present sequence is
CC that of a canine DNA sequence which was claimed for use during the
CC production of a canine microarray of the invention.

 XX
 CC The invention relates to 9672 polynucleotides (ACL5866-ACL63537) which
 CC are differentially expressed in colon cancer cells. The invention also
 CC relates to vectors and host cells comprising a differentially expressed
 CC polynucleotide of the invention; a method for detecting a cancerous cell
 CC by detection of a gene product of the polynucleotides; a method for
 CC inhibiting a cancerous phenotype of a cell by inhibiting a gene product
 CC of the polynucleotides; a method of treating an individual with cancer by
 CC administration of a modulator of a gene product of the polynucleotides;
 CC and an isolated antibody that specifically binds to a polypeptide encoded
 CC by one of the 9672 polynucleotides. The polynucleotides, polypeptides,
 CC antibodies, and methods are useful for the detection of cancerous cells;
 CC for the diagnosis, prognosis and management of cancer; for the
 CC identification of agents that modulate the phenotype of cancerous cells;
 CC and for the identification of therapeutic targets for cancer chemotherapy;
 CC and for the treatment of cancer, especially colon cancer and metastasized
 CC colon cancer, but also breast or pancreatic cancer. The polynucleotides
 CC are also useful as a source of probes or primers for use in diagnostic
 CC methods. The differentially expressed polynucleotides or their encoded
 CC proteins can additionally be used as vaccines to modulate primary immune
 CC responses for the prevention or treatment of cancer. The present sequence
 CC represents a specifically claimed polynucleotide which is differentially
 CC expressed in colon cancer. Note: The sequence data for this patent did
 CC not form part of the printed specification, but was obtained in

 PT Detecting a breast cancer-associated transcript in a patient's cell,
 PT useful for diagnosing breast cancer, comprises contacting a biological
 PT sample with a polynucleotide that selectively hybridizes with breast
 PT cancer nucleic acids.
 PT
 XX
 PS Claim 9; Page 372; 414pp; English.
 XX
 CC The invention comprises a method of detecting a breast cancer-associated
 CC transcript in a cell from a patient. The method of the invention involves
 CC contacting a biological sample from the patient with a nucleotide that
 CC hybridizes to one of the 69 breast cancer-associated gene sequences shown
 CC in the specification. The method of the invention is useful in the
 CC diagnosis or prognosis of breast cancer, and for detecting genes that are
 CC up or down-regulated in breast cancer cells. Genes identified by the
 CC method of the invention can be used in diagnostic purposes and also as
 CC targets for screening for therapeutic compounds that modulate breast
 CC cancer (e.g. hormones or antibodies). Identification of genes that are
 CC over or under expressed in breast cancer can additionally provide high-
 CC resolution, high-sensitivity datasets which can be used in the areas of
 CC diagnostics, therapeutics, drug development, pharmacogenetics, protein
 CC structure and biosensor development. DNA sequences ABT07693 - ABT07761
 CC represent the 69 breast cancer-associated gene sequences of the invention

 PT Detecting a lung cancer-associated transcript in a cell from a patient
 PT for treating lung cancer, by contacting a biological sample from the
 PT patient with a polynucleotide that exhibits increased or decreased
 PT expression in lung cancer.
 XX
 PS Claim 22; Page 336; 453pp; English.
 XX
 CC The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridizes
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

 PT Detecting an ovarian cancer-associated transcript in a cell from a
 PT patient, comprises contacting a biological sample from the patient with a
 PT polynucleotide that hybridizes to an ovarian cancer gene.
 XX
 PS Claim 10; Page 297; 332pp; English.
 XX
 CC The invention relates to a method of detecting an ovarian cancer-
 CC associated transcript in a cell from a patient, by contacting a
 CC biological sample from the patient with a polynucleotide that selectively
 CC hybridizes to a sequence at least 80% identical to any of 80
 CC nucleic acid sequences given in the specification. The method is useful
 CC in diagnosing ovarian cancer and in identifying and using agents and/or
 CC targets that inhibit ovarian cancer. The nucleic acid molecule,
 CC polypeptide and the antibody may also be used in detecting ovarian
 CC cancers, monitoring and early detection of relapse following treatment,
 CC monitoring response to therapy, selecting patients for post-operative
 CC chemotherapy or radiation therapy, in selecting mode of therapy
 CC determining tumour prognosis, early detection of pre-cancerous lesions,
 CC and as vaccines. This sequence corresponds to one of the nucleic acids
 CC used for the detection method of the invention.

XX
CC The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
CC whose expression is upregulated or downregulated in specific cancers or
CC other diseases such as angiogenic or fibrotic disorders, and to methods
CC of determining the presence or absence of a pathological cell in a
CC patient by detecting a nucleic acid at least 80% identical to those of
CC the invention or by detecting a polypeptide of the invention. The
CC invention also relates to expression vectors and host cells comprising a
CC nucleic acid of the invention; antibodies which specifically bind a
CC polypeptide of the invention; use of such antibodies for drug targeting;
CC and methods of screening for modulators of activity or expression of the
CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
CC antibodies and methods are useful for diagnosing, prognosing and treating
CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
CC neovascularisation syndromes, scarring and uterine fibroids. They may
CC also be useful in wound healing and in contraception. The present
CC sequence represents a nucleic acid sequence of the invention.

PT comprises contacting an assay system comprising a purified leucine rich
PT repeat, capricious related polypeptide or nucleic acid with a test agent.
XX
```

Example 5; Page 74-75; 99pp; English.

The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS related DNA

 XX New NOVX polypeptides and polynucleotides, useful for preventing,
 PT diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer,
 PT Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic
 disorders, and asthma.
 XX Claim 16; Page 114-115; 619pp; English.
 XX The present invention relates to new isolated proteins (NOVX) and their
 CC coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is
 CC any number from 1 to 48. The NOVX proteins and coding sequences are
 CC useful in the manufacture of a medicament for treating a syndrome
 CC associated with a human disease, preferably a NOVX-associated disorder.

CC The NOVX coding sequences and proteins are useful for treating,
 CC preventing or diagnosing diseases such as metabolic disorders, diabetes,
 CC obesity, infectious disease, anorexia, cancer-associated cachexia,
 CC cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's
 CC disease, immune disorders, haematopoietic disorders, cardiovascular
 CC disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic
 CC disturbances associated with obesity, metabolic syndrome X or wasting
 CC disorders associated with chronic diseases or various cancers. The NOVX
 CC coding sequences and proteins may also be used as targets for the
 CC identification of small molecules that modulate or inhibit e.g.
 CC neurogenesis, cell differentiation, cell proliferation, haematopoiesis,
 CC wound healing and angiogenesis, in gene therapy, in generation of
 CC antibodies that bind immunospecifically to NOVX substances for use in
 CC therapeutic or diagnostic methods

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

TITLE	Direct Submission				
JOURNAL	Submitted (02-FEB-2004) Sanger Institute, Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries: chicken@bms.umist.ac.uk				
COMMENT	BBSRC/Dundee/Nottingham/Sanger/Sheffield/UMIST Gallus gallus cdna sequencing project. This sequence is from the BBSRC/Dundee/Nottingham/Sanger/Sheffield/UMIST cdna collection, from a library constructed by Elizabeth Bosch. cdna was prepared from RNA extracted from heart, normalised, and poly A-trimmed.				

ECORI-NotI cut cDNA was then ligated into the vector. Vector:
pBluescript II KS(+); Site_1: EcoRI; Site_2: NotI Host: Escherichia
coli DH10B.

HS467D16 143583 bp DNA linear PRI 18-MAY-2005
LOCUS Human DNA sequence from clone RP3-467D16 on chromosome 6p22.3-24.1
DEFINITION Contains the 5' end of the SCAL gene for spinocerebellar ataxia 1
(OlivoPontocerebellar ataxia 1, autosomal dominant, ataxin 1) with
a poly-glutamine (CAG repeat) polymorphism and the 3' part of the
GMPR gene for GMP reductase, Guanosine 5'-monophosphate
oxidoreductase, complete sequence.
```

ACCESSION

```
AL009031
AL009031.1 GI:2808422
HTG; ataxia; ataxin; GMP reductase; GMPR; Guanosine; monophosphate;
olivopontocerebellar; oxidoreductase; SCAL; spinocerebellar.
```

SOURCE

```

AUTHORS

```
On Jan 25, 1998 this sequence version replaced gi:2632073.
The following abbreviations are used to associate primary accession
numbers given in the feature table with their source databases:
Em, EMBL; Sw, SwissProt; Tr, TrEMBL; Wp, WormPeP; Information
on the WormPeP database can be found at
http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence
was generated from part of bacterial clone contigs of human
chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping
Group. Further information can be found at
http://www.sanger.ac.uk/HGP/Chr6
RP3-467D16 is from the library RPCI-3 constructed by the group of
```

Pieter de Jong. For further details see

Contact: vegas@sanger.ac.uk

This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one subclone; and the assembly was confirmed by restriction digest,
except on the rare occasion of the clone being a YAC.

              ----- Summary Statistics
              Center project name: M_BB0511A23
              Drafting center: WIBR

NOTICE:

This sequence was finished as follows unless otherwise noted:
all regions were double stranded, sequenced with an alternate
chemistry, or covered by high quality data (i.e. phred quality
>30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone, fosmid clone or direct clone walk sequence.
Sequence from the Mouse Genome Sequencing Consortium whole genome
shotgun may have been used to obtain the consensus sequence. The
assembly was confirmed by restriction digest.
This finishing standard has slightly changed from the previous
Human standard. Specifically, standards for regions of low sequence
complexity (such as dinucleotide repeats and small unit tandem
repeats) have been relaxed. These regions are very prevalent in the
mouse genome, and the return on extended finishing efforts is
minimal.
If a sequence meets the criteria of the above statement, it needs
no comments or tags. If the criteria are not met, such as ambiguous
bases, then the region is duly annotated.

MAPPING INFORMATION:
Mapping information for this clone was provided by Dr. Wes Warren,
Department of Genetics, Washington University, St. Louis MO. For
additional information about the map position of this sequence, see
http://genome.wustl.edu

SOURCE INFORMATION:
The BAC Library has been constructed by Pieter de Jong and
coworkers (http://www.chori.org) from male C57BL/6J mouse spleen
and/or brain genomic DNA. The clone and detailed information can be
obtained from Pieter de Jong and coworkers at http://www.chori.org

This sequence is the entire insert of the clone.

 XX A method, useful for prognosing and treating solid tumor, comprises
 PT comparing an expression profile of a gene expressed in peripheral blood
 PT mononuclear cells to a reference expression profile of a gene.
 XX
 XX Disclosure; Page: 111pp; English.
 XX
 CC The invention describes a method comprising comparing an expression
 CC profile of at least one gene in a peripheral blood sample of a patient to
 CC at least one reference expression profile of the at least one gene, where
 CC the patient has a solid tumour, and each of the gene is differentially

CC expressed in peripheral blood mononuclear cells (PBMCs) of a first class
 CC of patients as compared to PBMCs of a second class of patients, where
 CC both the first and second classes of patients have the solid tumour, and
 CC each of the first and second classes is a subcluster formed by an
 CC unsupervised clustering analysis of gene expression profiles in PBMCs of
 CC a population of patients who have the solid tumour, and where the
 CC majority of the first class of patients has a first clinical outcome, and
 CC the majority of the second class of patients has a second clinical
 CC outcome. Also described are: a system comprising (i) a memory or a
 CC storage medium including data that represent an expression profile of at
 CC least one gene in a peripheral blood sample of a patient who has a solid
 CC tumour, (ii) at least another storage medium including data that
 CC represent at least one reference expression profile of the gene, (iii) a
 CC program capable of comparing the expression profile to the reference
 CC expression profile, and (iv) a processor capable of executing the
 CC program, where expression levels of the gene in peripheral blood
 CC mononuclear cells of patients who have the solid tumour correlate with
 CC clinical outcomes of the patients; and a nucleic acid or protein array
 CC comprising concentrated probes for solid tumour prognosis genes, where
 CC each of the solid tumour prognosis genes is differentially expressed in
 CC PBMCs of a first class of patients as compared to PBMCs of a second class
 CC of patients, where both the first and second classes of patients have a
 CC solid tumour, and where the first class of patients has a first clinical
 CC outcome, and the second class of patients has a second clinical outcome.
 CC The method, system, and array are useful for prognosing and treating
 CC solid tumours. This sequence represents a solid tumour prognosis gene of
 CC the invention. Note: The sequence data for this patent did not form part
 CC of the printed specification, but was obtained in electronic format
 CC directly from WIPO at ftp.wipo.int/pub/published_pat_sequences.

FT FT Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
 response useful in vaccinating against and in treating tumors.

FT FT Disclosure; Page 78-79; 79pp; English.

FT FT The present sequence encodes the canine 5T4 tumour-associated antigen
 (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in

CC carcinomas but has a highly restricted expression pattern in normal adult
 CC tissues. It appears to be strongly correlated to metastasis in colorectal
 CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
 CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
 CC induced were inoculated with a virus expression vector containing the
 CC human or murine 5T4 gene sequence. The 5T4 antigen was shown to be
 CC effective at eliciting an immunotherapeutic anti-tumour response. Both
 CC the nucleic acid encoding the antigen and the antigen itself can be used
 CC to elicit an immune response, preferably CTL or an antibody response in a
 CC subject

XX PT Detecting a breast cancer-associated transcript in a patient's cell,
 PT useful for diagnosing breast cancer, comprises contacting a biological
 PT sample with a polynucleotide that selectively hybridizes with breast
 PT cancer nucleic acids.

XX PS Claim 9; Page 372; 414pp; English.

XX The invention comprises a method of detecting a breast cancer-associated
 CC transcript in a cell from a patient. The method of the invention involves
 CC contacting a biological sample from the patient with a nucleotide that
 CC hybridises to one of the 69 breast cancer-associated gene sequences shown

CC in the specification. The method of the invention is useful in the
 CC diagnosis or prognosis of breast cancer, and for detecting genes that are
 CC up or down-regulated in breast cancer cells. Genes identified by the
 CC method of the invention can be used in diagnostic purposes and also as
 CC targets for screening for therapeutic compounds that modulate breast
 CC cancer (e.g. hormones or antibodies). Identification of genes that are
 CC over or under expressed in breast cancer can additionally provide high-
 CC resolution, high-sensitivity datasets which can be used in the areas of
 CC diagnostics, therapeutics, drug development, pharmacogenetics, protein
 CC structure and biosensor development. DNA sequences ABT07693 - ABT07761
 CC represent the 69 breast cancer-associated gene sequences of the invention

XX PT Detecting a lung cancer-associated transcript in a cell from a patient
 XX for treating lung cancer, by contacting a biological sample from the
 XX patient with a polynucleotide that exhibits increased or decreased
 XX expression in lung cancer.

XX PS Claim 22; Page 336; 453pp; English.

XX

CC The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridises
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

XX Detecting an ovarian cancer-associated transcript in a cell from a

PT patient, comprises contacting a biological sample from the patient with a

PT polynucleotide that hybridizes to an ovarian cancer gene.

XX

PS Claim 10; Page 297; 332pp; English.

XX

XX The invention relates to a method of detecting an ovarian cancer-

CC associated transcript in a cell from a patient, by contacting a

CC biological sample from the patient with a polynucleotide that selectively

CC hybridizes to a sequence at least 80% identical to any of one of 80

CC nucleic acid sequences given in the specification. The method is useful

CC in diagnosing ovarian cancer and in identifying and using agents and/or

CC targets that inhibit ovarian cancer. The nucleic acid molecule,

CC polypeptide and the antibody may also be used in detecting ovarian

CC cancers, monitoring and early detection of relapse following treatment,

CC monitoring response to therapy, selecting patients for post-operative

CC chemotherapy or radiation therapy, in selecting mode of therapy,

CC determining tumour prognosis, early detection of pre-cancerous lesions,

CC and as vaccines. This sequence corresponds to one of the nucleic acids

CC used for the detection method of the invention.

XX

XX Determining the presence or absence of a pathological cell in a patient,

PT useful for diagnosing, prognosing or treating cancer, comprises detecting

PT a nucleic acid in a biological sample.

XX

XX Claim 8; SEQ ID NO 41; 1385pp; English.

XX

XX The invention relates to nucleic acids and proteins (ADN38683-ADN40064)

CC whose expression is upregulated or downregulated in specific cancers or

CC other diseases such as angiogenic or fibrotic disorders, and to methods

CC of determining the presence or absence of a pathological cell in a

CC patient by detecting a nucleic acid at least 80% identical to those of

CC the invention or by detecting a polypeptide of the invention. The

CC invention also relates to expression vectors and host cells comprising a

CC nucleic acid of the invention; antibodies which specifically bind a

CC polypeptide of the invention; use of such antibodies for drug targeting;

CC and methods of screening for modulators of activity or expression of the

CC polypeptides and nucleic acids. The nucleic acids, polypeptides,

CC antibodies and methods are useful for diagnosing, prognosing and treating

CC cancer and other conditions such as psoriasis, ischaemia, heart disease,

CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal

CC neovascularization syndromes, scarring and uterine fibroids. They may

CC also be useful in wound healing and in contraception. The present

CC sequence represents a nucleic acid sequence of the invention.

XX New NOVX polypeptides and polynucleotides, useful for preventing,
 PT diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer,
 PT Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic
 PT disorders, and asthma.

XX Claim 16; Page 114-115; 619pp; English.

XX The present invention relates to new isolated proteins (NOVX) and their
 CC coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is
 CC any number from 1 to 48. The NOVX proteins and coding sequences are
 CC useful in the manufacture of a medicament for treating a syndrome
 CC associated with a human disease, preferably a NOVX-associated disorder.
 CC The NOVX coding sequences and proteins are useful for treating,
 CC preventing or diagnosing diseases such as metabolic disorders, diabetes,
 CC obesity, infectious diseases, anorexia, cancer-associated cachexia,
 CC cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's
 CC disease, immune disorders, hematopoietic disorders, cardiovascular
 CC disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic
 CC disturbances associated with obesity, metabolic syndrome X or wasting
 CC disorders associated with chronic diseases or various cancers. The NOVX
 CC coding sequences and proteins may also be used as targets for the
 CC identification of small molecules that modulate or inhibit e.g.
 CC neurogenesis, cell differentiation, cell proliferation, hematopoiesis,
 CC wound healing and angiogenesis, in gene therapy, in generation of
 CC antibodies that bind immunospecifically to NOVX substances for use in
 CC therapeutic or diagnostic methods

XX Novel canine or feline 5T4 polypeptide and polynucleotides encoding the
 PT polypeptide, useful in preparation of vaccine for treating and/or
 PT preventing cancer in a subject, preferably a dog or cat.

XX Claim 4; Page 68; 68pp; English.

XX The present invention relates to the isolation of canine and feline
 CC oncofoetal leucine-rich glycoproteins known as 5T4, and the
 CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in
 CC a significant proportion of tumours. The sequences of the invention are
 CC useful in a pharmaceutical composition for the prevention and/or
 CC treatment of tumours or other diseases associated with cell
 CC proliferation, infections, and inflammatory conditions in animals,
 CC preferably dogs or cats. The compositions may also be used for cancer
 CC immunotherapy in these animals. The sequences of the invention may also
 CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
 CC measurement and localisation of 5T4 in extracts of plasma, urine,
 CC tissues, and in cell culture media. Antibodies specific for the 5T4
 CC protein are useful for isolating foetal cells from maternal blood. The
 CC isolation process may form part of a diagnostic method e.g. the foetal
 CC cells may then be subject to biochemical or genetic sampling used for
 CC testing foetal abnormalities, or to determine the sex of the foetus (es).
 CC The present sequence encodes feline 5T4 protein

XX 5T4 tumor-associated antigen, useful for preventing and/or treating a
XX disease, particularly cancer.
XX
XX Disclosure; Page 67; 73pp; English.
XX
XX The invention relates to a novel Major Histocompatibility Complex (MHC)
XX class I peptide epitope of the 5T4 antigen. The invention further
XX provides a polypeptide string comprising the 5T4 epitope; a nucleic acid
XX sequence encoding the 5T4 epitope or a polypeptide string of the 5T4
XX epitope; a vector system capable of delivering the 5T4 epitope nucleic
XX acid to a cell; a cell pulsed with the 5T4 epitope, a polypeptide of the
XX 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine
XX comprising the above; a method for treating and/or preventing a disease
XX in a subject by administering the vaccine; an agent capable of binding
XX specifically to the 5T4 epitope and/its encoding nucleic acid; a method
XX comprising detecting the presence of the 5T4 epitope or its encoding
XX nucleic acid in a subject; and a T cell line or clone capable of
XX specifically recognising the 5T4 epitope in conjunction with an MHC class
XX I molecule. The 5T4 epitope has cytostatic activity. The vaccine
XX comprising the 5T4 epitope or its encoding nucleic acid and the vector
XX system or cell is useful in the prevention and/or treatment of a disease,
XX particularly cancer. The detection method is useful for diagnosing or
XX monitoring the progression of a cancerous disease, and for detecting the
XX presence of the 5T4 epitope or its nucleic acid. The T cell line or clone
XX is useful in the manufacture of a medicament for treating and/or
XX preventing a disease. This polynucleotide sequence represents the feline
XX 5T4 antigen coding DNA of the invention.

XX Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
PT response useful in vaccinating against and in treating tumors.
XX Example 2; Page 78; 79pp; English.
XX The present sequence encodes the human 5T4 tumour-associated antigen
CC (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
CC carcinomas but has a highly restricted expression pattern in normal adult
CC tissues. It appears to be strongly correlated to metastasis in colorectal
CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
CC induced were inoculated with a virus expression vector containing the
CC present sequence. The 5T4 antigen was shown to be effective at eliciting
CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
CC the antigen and the antigen itself can be used to elicit an immune
CC response, preferably CTL or an antibody response in a subject

XX Use of single chain antibody capable of recognizing a disease associated
PT molecule for manufacturing a medicament for preventing and/or treating a
XX disease condition associated with disease associated molecule.
XX Disclosure; Fig 26; 118pp; English.
XX The specification describes the use of a single chain antibody (ScFv),
CC which is capable of recognizing a disease associated molecule in the
CC manufacture of a medicament for the prevention and treatment of a disease
CC condition. The ScFv antibody is useful in the manufacture of a
CC medicament, for affecting a disease in vivo, for preparing a
CC pharmaceutical composition, for in vivo imaging and/or for adjuvant
CC treatment of a disease. The ScFv antibody is also useful for treating
CC inflammatory diseases including arthritis, hypersensitivity, autoimmune
CC diseases, cancers, central nervous system disorders including Parkinson's
CC disease, periodontal diseases, cardiopulmonary diseases, cardiovascular
CC diseases, gastrointestinal disorders, infections, diabetes, Helicobacter-
CC related diseases, and other immune disorders. The present sequence
CC encodes a 5T4 protein, which is used to produce ScFv of the invention

XX Claim 1; Page 67; 68pp; English.
XX
XX The present invention relates to the isolation of canine and feline
XX oncofoetal leucine-rich glycoproteins known as 5T4, and the
XX polynucleotide sequences encoding them. The 5T4 proteins are expressed in
XX a significant proportion of tumours. The sequences of the invention are
XX useful in a pharmaceutical composition for the prevention and/or
XX treatment of tumours or other diseases associated with cell
XX proliferation, infections, and inflammatory conditions in animals,
XX preferably dogs or cats. The compositions may also be used for cancer
XX immunotherapy in these animals. The sequences of the invention may also
XX be used in diagnostic kits for rapid, reliable, sensitive, and specific
XX measurement and localisation of 5T4 in extracts of plasma, urine,
XX tissues, and in cell culture media. Antibodies specific for the 5T4
XX protein are useful for isolating foetal cells from maternal blood. The
XX isolation process may form part of a diagnostic method e.g. the foetal
XX cells may then be subject to biochemical or genetic sampling used for
XX testing foetal abnormalities, or to determine the sex of the foetus(es).
XX The present sequence encodes canine 5T4 protein
XX

 PT Tumor associated antigen, 574 capable of eliciting cytotoxic T-lymphocyte
 PT response useful in vaccinating against and in treating tumors.
 XX
 PS Example 2; Page 78; 79pp; English.
 XX
 CC The present sequence encodes the mouse 574 tumour-associated antigen
 CC ('TAA'). The TAA 574 is a glycoprotein which is widely expressed in
 CC carcinomas but has a highly restricted expression pattern in normal adult
 CC tissues. It appears to be strongly correlated to metastasis in colorectal
 CC and gastric cancer. 574 antigen may therefore be useful in tumour
 CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
 CC induced were inoculated with a virus expression vector containing the
 CC present sequence. The 574 antigen was shown to be effective at eliciting
 CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
 CC the antigen and the antigen itself can be used to elicit an immune
 CC response, preferably CTL or an antibody response in a subject. The
 CC present sequence appears in GenBank at accession number AJ012160

 PT New signal transducer and activator of transcription 6 activation
 PT promoting purified protein, for diagnosing and treating disease
 PT associated with activation/inhibition of transcription factor e.g.
 PT diabetes and cancer.
 XX
 PS Claim 4; SEQ ID NO 125; 1368pp; English.
 XX
 CC The invention relates to a purified protein promoting signal transducer
 CC and activator of transcription 6 activation (STAT6). The protein is
 CC useful for producing an antibody, which involves administering the
 CC protein or its epitope-bearing fragments to a non-human animal as an
 CC antigen. The nucleic acid is useful for diagnosing a disease or
 CC susceptibility to a disease related to expression or activity of the
 CC protein. A transformant expressing the protein is useful for screening
 CC compounds which inhibit or promote STAT6 activation. A transformant
 CC expressing the protein is useful for producing a pharmaceutical
 CC composition. Compositions, antibodies and antisense molecules are useful
 CC for the treating a disease associated with STAT6 activation such as
 CC allergic diseases, inflammation, autoimmune diseases, diabetes,
 CC hyperlipidaemia, infections disease and cancers. Compositions are useful
 CC for treating disease associated with STAT6 activation and/or prevention
 CC of Th1 hyperactive diseases. Compositions are also useful in rheumatoid
 CC arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,
 CC allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,
 CC viral hepatitis and AIDS. The protein has efficient promoting STAT6
 CC activity. The protein or nucleic acid is effectively useful for screening
 CC compounds for treating and preventing disease associated with excessive
 CC activation or inhibition of STAT6. The present sequence represents a
 CC human cDNA encoding a protein which promotes STAT6 activation.

 XX XX New signal transducer and activator of transcription 6 activation
 PT promoting purified protein, for diagnosing and treating disease
 PT associated with activation/inhibition of transcription factor e.g.
 PT diabetes and cancer.
 XX XX Claim 4; SEQ ID NO 123; 1368pp; English.
 XX XX The invention relates to a purified protein promoting signal transducer
 CC and activator of transcription 6 activation (STAT6). The protein is
 CC useful for the producing an antibody, which involves administering the
 CC protein or its epitope-bearing fragments to a non-human animal as an
 CC antigen. The nucleic acid is useful for diagnosing a disease or
 CC susceptibility to a disease related to expression or activity of the
 CC protein. A transformant expressing the protein is useful for screening
 CC compounds which inhibit or promote STAT6 activation. A transformant
 CC expressing the protein is useful for producing a pharmaceutical
 CC composition. Compositions, antibodies and antisense molecules are useful
 CC for the treating a disease associated with STAT6 activation such as
 CC allergic diseases, inflammation, autoimmune diseases, diabetes,
 CC hyperlipidaemia, infectious disease and cancers. Compositions are useful
 CC for treating disease associated with STAT6 activation and/or prevention
 CC of Th1 hyperactive diseases. Compositions are also useful in rheumatoid
 CC arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,
 CC allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,
 CC viral hepatitis and AIDS. The protein has efficient promoting STAT6
 CC activity. The protein or nucleic acid is effectively useful for screening
 CC compounds for treating and preventing disease associated with excessive
 CC activation or inhibition of STAT6. The present sequence represents a
 CC human cDNA encoding a protein which promotes STAT6 activation.

XX Novel Pleckstrin homology domain interacting protein recruiting proteins
PT of insulin receptor substrate family, and signal transducer and activator
PT of transcription factors to their receptors, useful to treat diabetes.
XX Disclosure; Page 99-133; 139pp; English.
XX The invention relates to an isolated Pleckstrin homology domain
CC interacting protein (PHIP) that recruits proteins of the insulin receptor
CC substrate (IRS) family, and signal transducer and activator of
CC transcription (STAT) transcription factors, to receptors that interact
CC with and phosphorylate the proteins and STAT transcription factors, the
CC nucleic acid encoding PHIP (nPHIP), a nucleic acid which binds to nPHIP
CC or regions of it, analogues, fragments or allelic variants of PHIP or
CC nPHIP, a nucleic acid sequence having substantial sequence identity or
CC sequence similarity with a nucleic acid sequence fully defined human
CC neuronal differentiation-related protein (NDRP) nucleic acid sequence or
CC its exons as given in the specification, expression vectors and host
CC cells expressing the nucleic acids, anti-PHP antibodies, and a transgenic
CC animal not already expressing PHIP. The nucleic acids, proteins and
CC antibodies are useful for diagnosis and treatment of a condition
CC associated with an insulin receptor (e.g. diabetes mellitus type 2,
CC hyperglycaemia, myotonic muscular dystrophy, acanthosis, nigricans,
CC retinopathy, nephropathy, arteriosclerosis, peripheral arterial disease)
CC or cancer (e.g. adenocarcinoma, leukaemia, breast cancer, prostate
CC cancer, colon cancer, ovarian cancer and many others given in the
CC specification), autoimmune disease, inflammation and immunodeficiency.
CC The protein is also useful for discovering or testing compounds which may
CC be either enhancers or inhibitors of PHIP function. The present sequence
CC is genomic DNA encoding PHIP and NDRP

XX
PS Claim 2; SEQ ID NO 5770; 245pp; English.
XX
CC The invention relates to a purified nucleic acid molecule associated with
CC lactation or muscle and fat deposition (designated LMFD), derived from
CC nucleic acid molecule comprising any of 1512 nucleotide sequences,
CC appearing as ABX34836-ABX49947, or complements of them. Also included are
CC : (1) a transformed cell having a nucleic acid comprising an LMFD nucleic
CC acid linked to a promoter and a 3' non-translated sequence that
CC functions in the cell to cause termination of transcription and addition
CC of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and
CC (2) determining a level or pattern of a molecule in a bovine cell or
CC tissue comprising: (a) incubating a marker nucleic acid (comprising any
CC of the 1512 nucleic acid sequences or its complement or fragment) with a
CC complementary nucleic acid molecule obtained from the bovine cell or
CC tissue, where hybridisation between the marker nucleic acid and the
CC complementary nucleic acid permits the detection of the molecule; and (b)
CC detecting the level or pattern of the complementary nucleic acid, where
CC the detection of the complementary nucleic acid is predictive of the
CC level or pattern of the molecule. The LMFD nucleic acid is used for
CC determining a level or pattern of a molecule in a bovine cell or tissue.
CC It is useful for genome mapping, gene identification and analysis, cattle
CC breeding, preparation of constructs for use in cattle gene expression, or
CC for genetically improving cattle. The present sequence is one of the
CC 1512 bovine LMFD EST (expressed sequence tag) nucleic acids. Note: The
CC present sequence was not shown in the specification but was obtained in
CC electronic format from the USPTO web site:

 XX New isolated polynucleotides, which are differentially expressed in colon
 PT cancer cell, useful for treating cancer, e.g. colon cancer, breast
 PT cancer, or pancreatic cancer.
 PT
 XX Claim 1; SEQ ID NO 2281; 97pp; English.
 PS
 XX The invention relates to 9672 polynucleotides (ACL53866-ACL63537) which
 CC are differentially expressed in colon cancer cells. The invention also
 CC relates to vectors and host cells comprising a differentially expressed
 CC polynucleotide of the invention; a method for detecting a cancerous cell
 CC by detection of a gene product of the polynucleotides; a method for
 CC inhibiting a cancerous phenotype of a cell by inhibiting a gene product
 CC of the polynucleotides; a method of treating an individual with cancer by
 CC administration of a modulator of a gene product of the polynucleotides;
 CC and an isolated antibody that specifically binds to a polypeptide encoded
 CC by one of the 9672 polynucleotides. The polynucleotides, polypeptides,
 CC antibodies, and methods are useful for the detection of cancerous cells;
 CC for the diagnosis, prognosis and management of cancer; for the
 CC identification of agents that modulate the phenotype of cancerous cells;
 CC for the identification of therapeutic targets for cancer chemotherapy;
 CC and for the treatment of cancer, especially colon cancer and metastasized
 CC colon cancer, but also breast or pancreatic cancer. The polynucleotides
 CC are also useful as a source of probes or primers for use in diagnostic
 CC methods. The differentially expressed polynucleotides or their encoded
 CC proteins can additionally be used as vaccines to modulate primary immune
 CC responses for the prevention or treatment of cancer. The present sequence
 CC represents a specifically claimed polynucleotide which is differentially
 CC expressed in colon cancer. Note: The sequence data for this patent did
 CC not form part of the printed specification, but was obtained in
 CC electronic format directly from WIPO at
 CC ftp.wipo.int/pub/published_pct_sequences

 PT polypeptide, useful in preparation of vaccine for treating and/or
 PT preventing cancer in a subject, preferably a dog or cat.
 PT
 XX Claim 4; Page 68; 68pp; English.
 PS
 XX The present invention relates to the isolation of canine and feline
 CC oncofoetal leucine-rich glycoproteins known as 5T4, and the
 CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in
 CC a significant proportion of tumours. The sequences of the invention are
 CC useful in a pharmaceutical composition for the prevention and/or
 CC treatment of tumours or other diseases associated with cell
 CC proliferation, infections, and inflammatory conditions in animals,
 CC preferably dogs or cats. The compositions may also be used for cancer
 CC immunotherapy in these animals. The sequences of the invention may also
 CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
 CC measurement and localisation of 5T4 in extracts of plasma, urine,
 CC tissues, and in cell culture media. Antibodies specific for the 5T4
 CC protein are useful for isolating foetal cells from maternal blood. The
 CC isolation process may form part of a diagnostic method e.g. the foetal
 CC cells may then be subject to biochemical or genetic sampling used for
 CC testing foetal abnormalities, or to determine the sex of the foetus(es).

 XX XX New major histocompatibility complex class I peptide epitopes from human
 PT 5T4 tumor-associated antigen, useful for preventing and/or treating a
 PT disease, particularly cancer.
 XX PS Disclosure; Page 67; 73pp; English.
 XX CC The invention relates to a novel Major Histocompatibility Complex (MHC)
 CC class I peptide epitope of the 5T4 antigen. The invention further
 CC provides a polypeptide string comprising the 5T4 epitope; a nucleic acid
 CC sequence encoding the 5T4 epitope or a polypeptide string of the 5T4
 CC epitope; a vector system capable of delivering the 5T4 epitope nucleic
 CC acid to a cell; a cell pulsed with the 5T4 epitope, a polypeptide of the
 CC 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine
 CC comprising the above; a method for treating and/or preventing a disease
 CC in a subject by administering the vaccine; an agent capable of binding
 CC specifically to the 5T4 epitope and/its encoding nucleic acid; a method
 CC comprising detecting the presence of the 5T4 epitope or its encoding
 CC nucleic acid in a subject; and a T cell line or clone capable of
 CC specifically recognising the 5T4 epitope in conjunction with an MHC class
 CC I molecule. The 5T4 epitope has cytostatic activity. The vaccine
 CC comprising the 5T4 epitope or its encoding nucleic acid and the vector
 CC system or cell is useful in the prevention and/or treatment of a disease,
 CC particularly cancer. The detection method is useful for diagnosing or
 CC monitoring the progression of a cancerous disease, and for detecting the
 CC presence of the 5T4 epitope or its nucleic acid. The T cell line or clone
 CC is useful in the manufacture of a medicament for treating and/or
 CC preventing a disease. This polynucleotide sequence represents the feline
 CC 5T4 antigen coding DNA of the invention.

XX
PT Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
PT response useful in vaccinating against and in treating tumors.
XX
PS Example 2; Page 78; 79pp; English.
XX
CC The present sequence encodes the human 5T4 tumour-associated antigen
CC (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
CC carcinomas but has a highly restricted expression pattern in normal adult
CC tissues. It appears to be strongly correlated to metastasis in colorectal
CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
CC induced were inoculated with a virus expression vector containing the
CC present sequence. The 5T4 antigen was shown to be effective at eliciting
CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
CC the antigen and the antigen itself can be used to elicit an immune
CC response, preferably CTL or an antibody response in a subject

PT Use of single chain antibody capable of recognizing a disease associated
PT molecule for manufacturing a medicament for preventing and/or treating a
PT disease condition associated with disease associated molecule.
XX
PS Disclosure; Fig 26; 118pp; English.
XX
CC The specification describes the use of a single chain antibody (ScFv),
CC which is capable of recognizing a disease associated molecule in the
CC manufacture of a medicament for the prevention and treatment of a disease
CC condition. The ScFv antibody is useful in the manufacture of a
CC medicament, for affecting a disease in vivo, for preparing a
CC pharmaceutical composition, for in vivo imaging and/or for adjuvant
CC treatment of a disease. The ScFv antibody is also useful for treating
CC inflammatory diseases including arthritis, hypersensitivity, autoimmune
CC diseases, cancers, central nervous system disorders including Parkinson's
CC disease, periodontal diseases, cardiopulmonary diseases, cardiovascular
CC disease, gastrointestinal disorders, infections, diabetes, Helicobacter-
CC related diseases, and other immune disorders. The present sequence
CC encodes a 5T4 protein, which is used to produce ScFv of the invention

XX
XX Novel canine or feline 5T4 polypeptide and polynucleotides encoding the
XX polypeptide, useful in preparation of vaccine for treating and/or
XX preventing cancer in a subject, preferably a dog or cat.
XX
XX Claim 1; Page 67; 68pp; English.
XX
XX The present invention relates to the isolation of canine and feline
XX oncofoetal leucine-rich glycoproteins known as 5T4, and the
XX polynucleotide sequences encoding them. The 5T4 proteins are expressed in
XX a significant proportion of tumours. The sequences of the invention are
XX useful in a pharmaceutical composition for the prevention and/or
XX treatment of tumours or other diseases associated with cell
XX proliferation, infections, and inflammatory conditions in animals,
XX preferably dogs or cats. The compositions may also be used for cancer
XX immunotherapy in these animals. The sequences of the invention may also
XX be used in diagnostic kits for rapid, reliable, sensitive, and specific
XX measurement and localisation of 5T4 in extracts of plasma, urine,
XX tissues, and in cell culture media. Antibodies specific for the 5T4
XX protein are useful for isolating foetal cells from maternal blood. The
XX isolation process may form part of a diagnostic method e.g. the foetal
XX cells may then be subject to biochemical or genetic sampling used for
XX testing foetal abnormalities, or to determine the sex of the foetus(es).
XX The present sequence encodes canine 5T4 protein

COMMENT

----- Genome Center

Center: Washington University Genome Sequencing Center

Center code: WUGSC

Web site: http://genome.wustl.edu

Contact: submissions@wustl.edu

----- Summary Statistics

Center project name: M_BB0511A23

Drafting center: WIBR

NOTICE:

This sequence was finished as follows unless otherwise noted:
 all regions were double stranded, sequenced with an alternate
 chemistry, or covered by high quality data (i.e. phred quality
 >30); an attempt was made to resolve all sequencing problems, such
 as compressions and repeats; all regions were covered by at least
 one plasmid subclone, fosmid clone or direct clone walk sequence.
 Sequence from the Mouse Genome Sequencing Consortium whole genome
 shotgun may have been used to obtain the consensus sequence. The
 assembly was confirmed by restriction digest.

This finishing standard has slightly changed from the previous
 Human standard. Specifically, standards for regions of low sequence
 complexity (such as dinucleotide repeats and small unit tandem
 repeats) have been relaxed. These regions are very prevalent in the
 mouse genome, and the return on extended finishing efforts is
 minimal.

If a sequence meets the criteria of the above statement, it needs
 no comments or tags. If the criteria are not met, such as ambiguous
 bases, then the region is duly annotated.

MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. Wes Warren,
 Department of Genetics, Washington University, St. Louis MO. For
 additional information about the map position of this sequence, see
 http://genome.wustl.edu

SOURCE INFORMATION:

The BAC Library has been constructed by Pieter de Jong and
 coworkers (http://www.chori.org) from male C57BL/6J mouse spleen
 and/or brain genomic DNA. The clone and detailed information can be
 obtained from Pieter de Jong and coworkers at http://www.chori.org

This sequence is the entire insert of the clone.

Rat Genome Sequencing Consortium.

Direct Submission
Submitted (19-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Nov 19, 2002 this sequence version replaced gi:23265004.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

Center project name: GZGV
Center clone name: CH230-176H20

----- Summary Statistics
Assembly program: Phrap; version 0.990329
Consensus quality: 201761 bases at least Q40
Consensus quality: 203921 bases at least Q30
Consensus quality: 205310 bases at least Q20
Estimated insert size: 205531; sum-of-contigs estimation
Quality coverage: 7x in Q20 bases; sum-of-contigs estimation

* NOTE: Estimated insert size may differ from sequence length
(see http://www.hgsc.bcm.tmc.edu/docs/genbank/draft_data.html).
* NOTE: This is a 'working draft' sequence. It currently
* consists of 1 contigs. Gaps between the contigs
* are represented as runs of N. The order of the pieces
* is believed to be correct as given, however the sizes
* of the gaps between them are based on estimates that have
* provided by the submitter.
* This sequence will be replaced
* by the finished sequence as soon as it is available and
* the accession number will be preserved.
* 1 210237: contig of 210237 bp in length.

Rat Genome Sequencing Consortium.
Direct Submission
Submitted (20-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome

shotgun sequence only contigs will be indicated in the feature table.

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see <http://genome.wustl.edu>

SOURCE INFORMATION:

The RPCI-24 BAC Library has been constructed by Pieter de Jong and coworkers (<http://www.chori.org>) from male C57BL/6J mouse spleen and/or brain genomic DNA. The clone and detailed information can be obtained from Pieter de Jong and coworkers at <http://www.chori.org>

NEIGHBORING SEQUENCE INFORMATION:

This sequence is the entire insert of the clone. This clone is overlapped by AC121871.

 PT Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
 PT response useful in vaccinating against and in treating tumors.
 XX
 PS Example 2; Page 78; 79pp; English.
 XX
 CC The present sequence encodes the mouse 5T4 tumour-associated antigen
 CC (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
 CC carcinomas but has a highly restricted expression pattern in normal adult
 CC tissues. It appears to be strongly correlated to metastasis in colorectal
 CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
 CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
 CC induced were inoculated with a virus expression vector containing the
 CC present sequence. The 5T4 antigen was shown to be effective at eliciting
 CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
 CC the antigen and the antigen itself can be used to elicit an immune
 CC response, preferably CTL or an antibody response in a subject. The
 CC present sequence appears in GenBank at accession number AJ012160

 XX
 XX New signal transducer and activator of transcription 6 activation
 PT promoting purified protein, for diagnosing and treating disease
 PT associated with activation/inhibition of transcription factor e.g.
 PT diabetes and cancer.
 XX
 PS Claim 4; SEQ ID NO 125; 1368pp; English.
 XX
 CC The invention relates to a purified protein promoting signal transducer
 CC and activator of transcription 6 activation (STAT6). The protein is
 CC useful for the producing an antibody, which involves administering the
 CC protein or its epitope-bearing fragments to a non-human animal as an
 CC antigen. The nucleic acid is useful for diagnosing a disease or
 CC susceptibility to a disease related to expression or activity of the
 CC protein. A transformant expressing the protein is useful for screening
 CC compounds which inhibit or promote STAT6 activation. A transformant
 CC expressing the protein is useful for producing a pharmaceutical
 CC composition. Compositions, antibodies and antisense molecules are useful
 CC for the treating a disease associated with STAT6 activation such as
 CC allergic diseases, inflammation, autoimmune diseases, diabetes,
 CC hyperlipidaemia, infections disease and cancers. Compositions are useful
 CC for treating disease associated with STAT6 activation and/or prevention
 CC of Th1 hyperactive diseases. Compositions are also useful in rheumatoid
 CC arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,
 CC allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,
 CC viral hepatitis and AIDS. The protein has effectively useful for screening
 CC compounds for treating and preventing disease associated with excessive
 CC activation or inhibition of STAT6. The present sequence represents a
 CC human cDNA encoding a protein which promotes STAT6 activation.

 XX New nucleic acid associated with lactation, and muscle and fat
 PT deposition, useful for genome mapping, gene identification and analysis,
 PT cattle breeding, or for genetically improving cattle.
 XX Claim 2; SEQ ID NO 5770; 245pp; English.
 XX The invention relates to a purified nucleic acid molecule associated with
 CC lactation or muscle and fat deposition (designated LMFD), derived from
 CC cattle, and the LMFD nucleic acid can specifically hybridise to a second
 CC nucleic acid molecule comprising any of 15112 nucleotide sequences,
 CC appearing as ABX34836-ABX49947, or complements of them. Also included are
 CC : (1) a transformed cell having a nucleic acid comprising an LMFD nucleic
 CC acid linked to a promoter and a 3' non-translated sequence that
 CC functions in the cell to cause termination of transcription and addition
 CC of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and
 CC (2) determining a level or pattern of a molecule in a bovine cell or
 CC tissue comprising: (a) incubating a marker nucleic acid (comprising any
 CC of the 15112 nucleic acid sequences or its complement or fragment) with a
 CC complementary nucleic acid molecule obtained from the bovine cell or
 CC tissue, where hybridisation between the marker nucleic acid and the
 CC complementary nucleic acid permits the detection of the molecule; and (b)
 CC detecting the level or pattern of the complementary nucleic acid, where
 CC the detection of the complementary nucleic acid is predictive of the
 CC level or pattern of the molecule. The LMFD nucleic acid is used for
 CC determining a level or pattern of a molecule in a bovine cell or tissue.
 CC It is useful for genome mapping, gene identification and analysis, cattle
 CC breeding, preparation of constructs for use in cattle gene expression, or
 CC for genetically improving cattle. The present sequence is one of the
 CC 15112 bovine LMFD EST (expressed sequence tag) nucleic acids. Note: The
 CC present sequence was not shown in the specification but was obtained in
 CC electronic format from the USPTO web site:
 CC seqdata.uspto.gov/sequence.html?docid=20020137139

 PT polypeptide, useful in preparation of vaccine for treating and/or
 PT preventing cancer in a subject, preferably a dog or cat.
 XX Claim 4; Page 68; 68pp; English.
 XX The present invention relates to the isolation of canine and feline
 CC oncofoetal leucine-rich glycoproteins known as 574, and the
 CC polynucleotide sequences encoding them. The 574 proteins are expressed in
 CC a significant proportion of tumours. The sequences of the invention are
 CC useful in a pharmaceutical composition for the prevention and/or
 CC treatment of tumours or other diseases associated with cell
 CC proliferation, infections, and inflammatory conditions in animals.
 CC preferably dogs or cats. The compositions may also be used for cancer
 CC immunotherapy in these animals. The sequences of the invention may also
 CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
 CC measurement and localisation of 574 in extracts of plasma, urine,
 CC tissues, and in cell culture media. Antibodies specific for the 574
 CC protein are useful for isolating foetal cells from maternal blood. The
 CC isolation process may form part of a diagnostic method e.g. the foetal
 CC cells may then be subject to biochemical or genetic sampling used for
 CC testing foetal abnormalities, or to determine the sex of the foetus(es).
 CC The present sequence encodes feline 574 protein

XX New major histocompatibility complex class I peptide epitopes from human
PT 5T4 tumor-associated antigen, useful for preventing and/or treating a
PT disease, particularly cancer.
XX
XX Disclosure; Page 67; 73pp; English.
XX
XX The invention relates to a novel Major Histocompatibility Complex (MHC)
CC class I peptide epitope of the 5T4 antigen. The invention further
CC provides a polypeptide string comprising the 5T4 epitope; a nucleic acid
CC sequence encoding the 5T4 epitope or a polypeptide string of the 5T4
CC epitope; a vector system capable of delivering the 5T4 epitope nucleic
CC acid to a cell; a cell pulsed with the 5T4 epitope, a polypeptide of the
CC 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine
CC comprising the above; a method for treating and/or preventing a disease
CC in a subject by administering the vaccine; an agent capable of binding
CC specifically to the 5T4 epitope and/its encoding nucleic acid; a method
CC comprising detecting the presence of the 5T4 epitope or its encoding
CC nucleic acid in a subject; and a T cell line or clone capable of
CC specifically recognising the 5T4 epitope in conjunction with an MHC class
CC I molecule. The 5T4 epitope has cytostatic activity. The vaccine
CC comprising the 5T4 epitope or its encoding nucleic acid and the vector
CC system or cell is useful in the prevention and/or treatment of a disease,
CC particularly cancer. The detection method is useful for diagnosing or
CC monitoring the progression of a cancerous disease, and for detecting the
CC presence of the 5T4 epitope or its nucleic acid. The T cell line or clone
CC is useful in the manufacture of a medicament for treating and/or
CC preventing a disease. This polynucleotide sequence represents the feline
CC 5T4 antigen coding DNA of the invention.

XX Use of single chain antibody capable of recognizing a disease associated
PT molecule for manufacturing a medicament for preventing and/or treating a
PT disease condition associated with disease associated molecule.
XX
XX Disclosure; Fig 26; 118pp; English.

CC The specification describes the use of a single chain antibody (ScFv),
CC which is capable of recognizing a disease associated molecule in the
CC manufacture of a medicament for the prevention and treatment of a disease
CC condition. The ScFv antibody is useful in the manufacture of a
CC medicament, for affecting a disease in vivo, for preparing a
CC pharmaceutical composition, for in vivo imaging and/or for adjuvant
CC treatment of a disease. The ScFv antibody is also useful for treating
CC inflammatory diseases including arthritis, hypersensitivity, autoimmune
CC diseases, cancers, central nervous system disorders including Parkinson's
CC disease, periodontal disease, cardiopulmonary diseases, cardiovascular
CC diseases, gastrointestinal disorders, infections, diabetes, Helicobacter-
CC related diseases, and other immune disorders. The present sequence
CC encodes a 5T4 protein, which is used to produce ScFv of the invention

CC anticancer agent comprising (I) as an active ingredient, screening (M1)

CC cancer cell specific apoptosis inducing agents, and manufacturing (I) as

CC a pharmaceutical composition (involving screening the compound by (M1)

CC and mixing the compound with a carrier). In (I), the compound which

CC inhibits the stabilization of a chromosome, is an agent capable of

CC inhibiting a human chromosome instability disease related gene,

CC chromosome replication of DNA, chromosome DNA reproduction reaction, DNA

CC damage check point, sister chromatid aggregation or isolation, base

CC excision repair, mismatch excision repair, nucleotide excision repair,

CC homologous-recombination restoration, non-homologous terminal binding

CC restoration, double-stranded DNA-cleavage repair, DNA post replication

CC repair (DNA damage tolerance), DNA crosslinking damage repair, DNA-

CC protein crosslinking damage repair, DNA polymerase, nuclease, nucleotide

CC purification, chromatin structure maintenance and telomere structure

CC maintenance. The compound, which suppresses the expression of the genes

CC

CC is a double-stranded RNA (siRNA, short interfering RNA), antisense

CC oligonucleotide, a variant protein having dominant negative character

CC with respect to protein encoded by the gene, an antibody and a low

CC molecular weight compound which binds to the protein encoded by the gene.

CC The compounds are useful as anticancer agents. (M1) is useful for

CC manufacturing a pharmaceutical composition comprising the compound. The

CC compound is useful for elucidating the mechanism of inducing cancer cell

CC specific apoptosis and is highly cancer cell specific, has few or no side

CC effects as an anticancer agent and damage produced in chromosomal DNA is

CC repaired. The present sequence is a cDNA representing a gene target for

CC the compounds of the invention.

XX CC Rad54, Rad6A, RPA34, RPA70, Scc1, Scc3, Sir2, Sirt1 (Sirtuin), TD, TDP1,
XX CC TIMELESS, Tin2, Topoisomerase I, Topoisomerase IIIa, Topoisomerase IIb,
XX CC Ubc13, UNG, XAB2, XPC, XPF, XPG, Xrcc2 and XRCC4. Also included are an
XX CC anticancer agent comprising (I) as an active ingredient, screening (M1)
XX CC cancer cell specific apoptosis inducing agents, and manufacturing (I) as
XX CC a pharmaceutical composition (involving screening the compound by (M1)
XX CC and mixing the compound with a carrier). In (I), the compound which
XX CC inhibits the stabilization of a chromosome, is an agent capable of
XX CC inhibiting a human chromosome instability disease related gene,
```

```
CC chromosome replication of DNA, chromosome DNA reproduction reaction, DNA
CC damage check point, sister chromatid aggregation or isolation, base
CC excision repair, mismatch excision repair, nucleotide excision repair,
CC homologous-recombination restoration, non-homologous terminal binding
CC restoration, double-stranded DNA-cleavage repair, DNA post replication
CC repair (DNA damage tolerance), DNA crosslinking damage repair, DNA-
CC protein crosslinking damage repair, DNA polymerase, nuclease, nucleotide
CC purification, chromatin structure maintenance and telomere structure
CC maintenance. The compound, which suppresses the expression of the genes
CC is a double-stranded RNA (siRNA, short interfering RNA), antisense
CC oligonucleotide, a variant protein having dominant negative character
CC with respect to protein encoded by the gene, an antibody and a low
CC molecular weight compound which binds to the protein encoded by the gene.
CC The compounds are useful as anticancer agents. (M1) is useful for
CC manufacturing a pharmaceutical composition comprising the compound. The
CC compound is useful for elucidating the mechanism of inducing cancer cell
CC specific apoptosis and is highly cancer cell specific, has few or no side
CC effects as an anticancer agent and damage produced in chromosomal DNA is
CC repaired. The present sequence is a cDNA representing a gene target for
CC the compounds of the invention.

----- Summary Statistics

Center project name: M_BB0511A23

Drafting center: WIBR

NOTICE:

This sequence was finished as follows unless otherwise noted:
 all regions were double stranded, sequenced with an alternate
 chemistry, or covered by high quality data (i.e. phred quality
 >30); an attempt was made to resolve all sequencing problems, such
 as compressions and repeats; all regions were covered by at least
 one plasmid subclone, fosmid clone or direct clone walk sequence.
 Sequence from the Mouse Genome Sequencing Consortium whole genome
 shotgun may have been used to obtain the consensus sequence. The
 assembly was confirmed by restriction digest.

This finishing standard has slightly changed from the previous
 Human standard. Specifically, standards for regions of low sequence
 complexity (such as dinucleotide repeats and small unit tandem
 repeats) have been relaxed. These regions are very prevalent in the
 mouse genome, and the return on extended finishing efforts is
 minimal.

If a sequence meets the criteria of the above statement, it needs
 no comments or tags. If the criteria are not met, such as ambiguous
 bases, then the region is duly annotated.

MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. Wes Warren,
 Department of Genetics, Washington University, St. Louis MO. For
 additional information about the map position of this sequence, see
 http://genome.wustl.edu

SOURCE INFORMATION:

The BAC Library has been constructed by Pieter de Jong and
 coworkers (http://www.chori.org) from male C57BL/6J mouse spleen
 and/or brain genomic DNA. The clone and detailed information can be
 obtained from Pieter de Jong and coworkers at http://www.chori.org

This sequence is the entire insert of the clone.

Rat Genome Sequencing Consortium.
Direct Submission
Submitted (19-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Nov 19, 2002 this sequence version replaced gi:23265004.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

----- Project Information
Center project name: GZGV
Center clone name: CH230-176H20

----- Summary Statistics
Assembly program: Phrap; version 0.990329
Consensus quality: 201781 bases at least Q40
Consensus quality: 203921 bases at least Q30
Consensus quality: 205310 bases at least Q20
Estimated insert size: 205531; sum-of-contigs estimation
Quality coverage: 7x in Q20 bases; sum-of-contigs estimation

* NOTE: Estimated insert size may differ from sequence length
(see http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html).
* NOTE: This is a 'working draft' sequence. It currently
* consists of 1 contigs. Gaps between the contigs
* are represented as runs of N. The order of the pieces
* is believed to be correct as given, however the sizes
* of the gaps between them are based on estimates that have
* provided by the submitter.
* This sequence will be replaced
* by the finished sequence as soon as it is available and
* the accession number will be preserved.
* 1 210237: contig of 210237 bp in length.

COMMENT

On Nov 20, 2002 this sequence version replaced gi:22857070. The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome

shotgun sequence only contigs will be indicated in the feature table.

----- Summary Statistics

Assembly program: Phrap; version 0.990329
Consensus quality: 228642 bases at least Q40
Consensus quality: 232269 bases at least Q30
Consensus quality: 234041 bases at least Q20

Estimated insert size: 231522; sum-of-contigs estimation

Quality coverage: 7x in Q20 bases; sum-of-contigs estimation

* NOTE: Estimated insert size may differ from sequence length
* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
* NOTE: This is a 'working draft' sequence. It currently
* consists of 4 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

* 1 234710: contig of 234710 bp in length

* 234711 234810: gap of unknown length

* 234811 235924: contig of 1114 bp in length

* 235925 236024: gap of unknown length

* 236025 237314: contig of 1290 bp in length

* 237315 239076: gap of unknown length

* 237415 239076: contig of 1662 bp in length.

Rat Genome Sequencing Consortium.
Direct Submission
Submitted (19-NOV-2002) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
On Nov 19, 2002 this sequence version replaced gi:23907923.
The sequence in this assembly is a combination of BAC based reads
and whole genome shotgun sequencing reads assembled using Atlas
(http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
in the feature table below represents a scaffold in the Atlas
assembly (a 'contig-scaffold'). Within each contig-scaffold,
individual sequence contigs are ordered and oriented, and separated
by sized gaps filled with Ns to the estimated size. The sequence
may extend beyond the ends of the clone and there may be sequence
contigs within a contig-scaffold that consist entirely of whole
genome shotgun sequence reads. Both end sequences and whole genome
shotgun sequence only contigs will be indicated in the feature
table.

----- Project Information
Center project name: GZFE
Center clone name: CH230-231L11
----- Summary Statistics
Assembly program: Phrap; version 0.990329
Consensus quality: 237334 bases at least Q40
Consensus quality: 239688 bases at least Q30
Consensus quality: 240866 bases at least Q20
Estimated insert size: 244791; sum-of-contigs estimation
Quality coverage: 7x in Q20 bases; sum-of-contigs estimation
-----
* NOTE: Estimated insert size may differ from sequence length
  (see http://www.hgsc.bcm.tmc.edu/docs/Genbank\_draft\_data.html).
* NOTE: This is a 'working draft' sequence. It currently
* consists of 1 contigs. Gaps between the contigs
* are represented as runs of N. The order of the pieces
* is believed to be correct as given, however the sizes
* of the gaps between them are based on estimates that have
* provided by the submittor.
* This sequence will be replaced
* by the finished sequence as soon as it is available and
* the accession number will be preserved.
*
* 1 244451: contig of 244451 bp in length.

 PT Tumor associated antigen, 574 capable of eliciting cytotoxic T-lymphocyte
 PT response useful in vaccinating against and in treating tumors.
 XX
 PS Example 2; Page 78; 79pp; English.
 XX
 CC The present sequence encodes the mouse 574 tumour-associated antigen
 CC (TAA). The TAA 574 is a glycoprotein which is widely expressed in
 CC carcinomas but has a highly restricted expression pattern in normal adult
 CC tissues. It appears to be strongly correlated to metastasis in colorectal
 CC and gastric cancer. 574 antigen may therefore be useful in tumour
 CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
 CC induced were inoculated with a virus expression vector containing the
 CC present sequence. The 574 antigen was shown to be effective at eliciting
 CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
 CC the antigen and the antigen itself can be used to elicit an immune
 CC response, preferably CTL or an antibody response in a subject. The
 CC present sequence appears in GenBank at accession number AJ012160

 PT New signal transducer and activator of transcription 6 activation
 PT promoting purified protein, for diagnosing and treating disease
 PT associated with activation/inhibition of transcription factor e.g.
 PT diabetes and cancer.
 XX
 PS Claim 4; SEQ ID NO 125; 1368pp; English.
 XX
 CC The invention relates to a purified protein promoting signal transducer
 CC and activator of transcription 6 activation (STAT6). The protein is
 CC useful for the producing an antibody, which involves administering the
 CC protein or its epitope-bearing fragments to a non-human animal as an
 CC antigen. The nucleic acid is useful for diagnosing a disease or
 CC susceptibility to a disease related to expression or activity of the
 CC protein. A transformant expressing the protein is useful for screening
 CC compounds which inhibit or promote STAT6 activation. A transformant
 CC expressing the protein is useful for producing a pharmaceutical
 CC composition. Compositions, antibodies and antisense molecules are useful
 CC for the treating a disease associated with STAT6 activation such as
 CC allergic diseases, inflammation, autoimmune diseases, diabetes,
 CC hyperlipidaemia, infections disease and cancers. Compositions are useful
 CC for treating disease associated with STAT6 activation and/or prevention
 CC of Th1 hyperactive diseases. Compositions are also useful in rheumatoid
 CC arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma,
 CC allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,
 CC viral hepatitis and AIDS. The protein has efficient promoting STAT6
 CC activity. The protein or nucleic acid is effectively useful for screening
 CC compounds for treating and preventing disease associated with excessive
 CC activation or inhibition of STAT6. The present sequence represents a
 CC human cDNA encoding a protein which promotes STAT6 activation.

 XX Use of single chain antibody capable of recognizing a disease associated
 PT molecule for manufacturing a medicament for preventing and/or treating a
 PT disease condition associated with disease associated molecule.
 XX Disclosure; Fig 26; 118pp; English.
 XX The specification describes the use of a single chain antibody (ScFv),
 CC which is capable of recognizing a disease associated molecule in the
 CC manufacture of a medicament for the prevention and treatment of a disease
 CC condition. The ScFv antibody is useful in the manufacture of a
 CC medicament, for affecting a disease in vivo, for preparing a
 CC pharmaceutical composition, for in vivo imaging and/or for adjuvant
 CC treatment of a disease. The ScFv antibody is also useful for treating
 CC inflammatory diseases including arthritis, hypersensitivity, autoimmune
 CC diseases, cancers, central nervous system disorders including Parkinson's
 CC disease, periodontal diseases, cardiopulmonary diseases, cardiovascular
 CC diseases, gastrointestinal disorders, infections, diabetes, Helicobacter-
 CC related diseases, and other immune disorders. The present sequence
 CC encodes a 5T4 protein, which is used to produce ScFv of the invention

XX
XX Novel canine or feline 5T4 polypeptide and polynucleotides encoding the
PT polypeptide, useful in preparation of vaccine for treating and/or
PT preventing cancer in a subject, preferably a dog or cat.
XX
XX Claim 1; Page 67; 68pp; English.
XX
XX The present invention relates to the isolation of canine and feline
CC oncofoetal leucine-rich glycoproteins known as 5T4, and the
CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in
CC a significant proportion of tumours. The sequences of the invention are
CC useful in a pharmaceutical composition for the prevention and/or
CC treatment of tumours or other diseases associated with cell
CC proliferation, infections, and inflammatory conditions in animals,
CC preferably dogs or cats. The compositions may also be used for cancer
CC immunotherapy in these animals. The sequences of the invention may also
CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
CC measurement and localisation of 5T4 in extracts of plasma, urine,
CC tissues, and in cell culture media. Antibodies specific for the 5T4
CC protein are useful for isolating foetal cells from maternal blood. The
CC isolation process may form part of a diagnostic method e.g. the foetal
CC cells may then be subject to biochemical or genetic sampling used for
CC testing foetal abnormalities, or to determine the sex of the foetus(es).
CC The present sequence encodes canine 5T4 protein

XX
XX Determining open reading frames of genome of an organism e.g. a human
PT suffering from cancer involves use of single oligonucleotide primer at
PT low stringency for preparing single-stranded cDNA from mRNA of
PT individual.
XX
XX Example 9; Page 302; 959pp; English.
XX
XX The invention describes a method of determining open reading frames in
CC the genome of organism, comprising contacting mRNA from cell of organism
CC with a single oligonucleotide primer (I) at low stringency, preparing
CC single-stranded cDNA by reverse transcribing mRNA with (I), amplifying
CC cDNA, sequencing the product, and repeating the contacting, preparing
CC and amplifying steps with different primers and sequencing resulting
CC nucleic acids. The method is useful for: determining that a known
CC nucleotide sequence from a genome of an organism corresponds to a
CC nucleotide sequence of an open reading frame; for preparing a contig,
CC nucleic acid molecule from a genome of an organism; and for sequencing
CC all or part of a genome of an organism. mRNA is obtained from mammalian
CC or human cell which is associated with a pathological condition e.g. a
CC colon cancer or breast cancer cell. The method is useful for analyses of
CC populations of subjects and can be used to carry out genetic analyses of
CC large or small populations. further, it can be used to study living
CC systems to determine if, e.g. there have been genetic shifts which render
CC an individual or population more or less likely to be afflicted with
CC diseases such as cancer, to determine antibiotic resistance or non-
CC tolerance, and so forth. The method can also be used in the study of
CC congenital diseases, and the risk of affliction to a foetus, as well as
CC the study of whether the conditions are likely to be passed to offspring
CC through ova or sperm. The analyses for pathological conditions can be
CC carried out in all animals, plants, birds, fish, etc. Using this method,
CC in the area of agriculture, for example the genomes of food crops can be
CC studied to determine if resistance genes are present, defects in plant
CC genomes can also be studied in this way. Similarly, the method permits
CC determination of the pathogens which integrate into the genome, such as
CC retroviruses and other integrating viruses such as influenza virus, have
CC undergone shifts or mutations, which may require different approaches to
CC therapy. This method is also applied to eukaryotic pathogens, such as
CC trypanosomes, different types of Plasmodium, etc. The method essentially
CC eliminates sequencing of non-coding portions. This sequence represents a
CC polynucleotide isolated from human colon cancer cell cDNA library

PT responsible for genetic disorders or other traits and to assess
PT biodiversity.
XX PT
XX Claim 1; SEQ ID NO 22978; 103pp; English.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this

XX A method, useful for prognosing and treating solid tumor, comprises
PT comparing an expression profile of a gene expressed in peripheral blood
PT mononuclear cells to a reference expression profile of a gene.
XX Disclosure; Page; 111pp; English.

The invention describes a method comprising comparing an expression profile of at least one gene in a peripheral blood sample of a patient to at least one reference expression profile of the at least one gene, where the patient has a solid tumour, and each of the gene is differentially expressed in peripheral blood mononuclear cells (PBMCs) of a first class of patients as compared to PBMCs of a second class of patients, where both the first and second classes of patients have the solid tumour, and each of the first and second classes is a subcluster formed by an unsupervised clustering analysis of gene expression profiles in PBMCs of a population of patients who have the solid tumour, and where the majority of the first class of patients has a first clinical outcome, and the majority of the second class of patients has a second clinical outcome. Also described are: a system comprising (i) a memory or a storage medium including data that represent an expression profile of at least one gene in a peripheral blood sample of a patient who has a solid

XX Detecting a lung cancer-associated transcript in a cell from a patient
 PT for treating lung cancer, by contacting a biological sample from the
 PT patient with a polynucleotide that exhibits increased or decreased
 PT expression in lung cancer.
 XX
 XX Claim 22; Page 336; 453pp; English.
 XX
 XX The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridizes
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

 XX
 XX Detecting an ovarian cancer-associated transcript in a cell from a
 PT patient, comprises contacting a biological sample from the patient with a
 PT polynucleotide that hybridizes to an ovarian cancer gene.
 XX
 XX Claim 10; Page 297; 332pp; English.

XX The invention relates to a method of detecting an ovarian cancer-
 CC associated transcript in a cell from a patient, by contacting a
 CC biological sample from the patient with a polynucleotide that selectively
 CC hybridizes to a sequence at least 80% identical to any of one of 80
 CC nucleic acid sequences given in the specification. The method is useful
 CC in diagnosing ovarian cancer and in identifying and using agents and/or
 CC targets that inhibit ovarian cancer. The nucleic acid molecule,
 CC polypeptide and the antibody may also be used in detecting ovarian
 CC cancers, monitoring and early detection of relapse following treatment,
 CC monitoring response to therapy, selecting patients for post-operative
 CC chemotherapy or radiation therapy, in selecting mode of therapy,
 CC determining tumour prognosis, early detection of pre-cancerous lesions,
 CC and as vaccines. This sequence corresponds to one of the nucleic acids
 CC used for the detection method of the invention.

New NOVX polypeptides and polynucleotides, useful for preventing,

diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer,

Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic

disorders, and asthma.

Claim 16; Page 114-115; 619pp; English.

The present invention relates to new isolated proteins (NOVX) and their

coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is

any number from 1 to 48. The NOVX proteins and coding sequences are

useful in the manufacture of a medicament for treating a syndrome

associated with a human disease, preferably a NOVX-associated disorder.

The NOVX coding sequences and proteins are useful for treating,

preventing or diagnosing diseases such as metabolic disorders, diabetes,

obesity, infectious disease, anorexia, cancer-associated cachexia,

cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's

disease, immune disorders, haematopoietic disorders, cardiovascular

disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic

disturbances associated with obesity, metabolic syndrome X or wasting

disorders associated with chronic diseases or various cancers. The NOVX

coding sequences and proteins may also be used as targets for the

identification of small molecules that modulate or inhibit e.g.

neurogenesis, cell differentiation, cell proliferation, haematopoiesis,

wound healing and angiogenesis, in gene therapy, in generation of

antibodies that bind immunospecifically to NOVX substances for use in

therapeutic or diagnostic methods

XX Novel canine or feline 5T4 polypeptide and polynucleotides encoding the

PT polypeptide, useful in preparation of vaccine for treating and/or

PT preventing cancer in a subject, preferably a dog or cat.

XX Claim 4; Page 68; 68pp; English.

XX The present invention relates to the isolation of canine and feline
 CC oncofoetal leucine-rich glycoproteins known as 5T4, and the
 CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in
 CC a significant proportion of tumours. The sequences of the invention are
 CC useful in a pharmaceutical composition for the prevention and/or
 CC treatment of tumours or other diseases associated with cell
 CC proliferation, infections, and inflammatory conditions in animals,
 CC preferably dogs or cats. The compositions may also be used for cancer
 CC immunotherapy in these animals. The sequences of the invention may also
 CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
 CC measurement and localisation of 5T4 in extracts of plasma, urine,
 CC tissues, and in cell culture media. Antibodies specific for the 5T4
 CC protein are useful for isolating foetal cells from maternal blood. The
 CC isolation process may form part of a diagnostic method e.g. the foetal
 CC cells may then be subject to biochemical or genetic sampling used for
 CC testing foetal abnormalities, or to determine the sex of the foetus(es).
 CC The present sequence encodes feline 5T4 protein

Clone distribution: MGC clone distribution information can be found
 through the I.M.A.G.E. Consortium/LLNL at: <http://image.llnl.gov>
 Series: IRAC Plate: 123 Row: p Column: 18
 This clone was selected for full length sequencing because it
 passed the following selection criteria: matched mRNA gi: 6755854.

TITLE

Direct Submission

JOURNAL

Submitted (19-NOV-2002)

Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Nov 19, 2002 this sequence version replaced gi:23265004.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

----- Project Information

Center project name: GZGV

Center clone name: CH230-176H20

----- Summary Statistics

Assembly program: Phrap; version 0.990329

Consensus quality: 201781 bases at least Q40

Consensus quality: 203921 bases at least Q30

Consensus quality: 205321 bases at least Q20

Estimated insert size: 205531; sum-of-contigs estimation

Quality coverage: 7x in Q20 bases; sum-of-contigs estimation

* NOTE: Estimated insert size may differ from sequence length

* (see http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html).

* NOTE: This is a 'working draft' sequence. It currently

* consists of 1 contigs. Gaps between the contigs

* are represented as runs of N. The order of the pieces

* is believed to be correct as given, however the sizes

* of the gaps between them are based on estimates that have

* provided by the submitter.

* This sequence will be replaced

* by the finished sequence as soon as it is available and

* the accession number will be preserved.

* 1 210237: contig of 210237 bp in length.

 XX
 XX Determining open reading frames of genome of an organism e.g. a human
 PT suffering from cancer involves use of single oligonucleotide primer at
 PT low stringency for preparing single-stranded cDNA from mRNA of
 PT individual.
 XX
 XX Example 9; Page 302; 959pp; English.
 PS
 XX
 XX The invention describes a method of determining open reading frames in
 CC the genome of organism, comprising contacting mRNA from cell of organism
 CC with a single oligonucleotide primer (I) at low stringency, preparing
 CC single-stranded cDNA by reverse transcribing mRNA with (I), amplifying
 CC cDNA, sequencing the product, and repeating the contacting, preparing
 CC and amplifying steps with different primers and sequencing resulting
 CC nucleic acids. The method is useful for: determining that a known
 CC nucleotide sequence from a genome of an organism corresponds to a
 CC nucleotide sequence of an open reading frame; for preparing a contig,
 CC nucleic acid molecule from a genome of an organism; and for sequencing
 CC all or part of a genome of an organism. mRNA is obtained from mammalian
 CC or human cell which is associated with a pathological condition e.g. a
 CC colon cancer or breast cancer cell. The method is useful for analyses of
 CC populations of subjects and can be used to carry out genetic analyses of
 CC large or small populations. Further, it can be used to study living
 CC systems to determine if, e.g. there have been genetic shifts which render
 CC an individual or population more or less likely to be afflicted with
 CC diseases such as cancer, to determine antibiotic resistance or non-
 CC tolerance, and so forth. The method can also be used in the study of
 CC congenital diseases, and the risk of affliction to a foetus, as well as
 CC the study of whether the conditions are likely to be passed to offspring
 CC through ova or sperm. The analyses for pathological conditions can be
 CC carried out in all animals, plants, birds, fish, etc. Using this method,
 CC in the area of agriculture, for example the genomes of food crops can be
 CC studied to determine if resistance genes are present, defects in plant
 CC genomes can also be studied in this way. Similarly, the method permits
 CC determination of the pathogens which integrate into the genome, such as
 CC retroviruses and other integrating viruses such as influenza virus, have
 CC undergone shifts or mutations, which may require different approaches to
 CC therapy. This method is also applied to eukaryotic pathogens, such as
 CC trypanosomes, different types of Plasmodium, etc. The method essentially
 CC eliminates sequencing of non-coding portions. This sequence represents a
 CC polynucleotide isolated from human colon cancer cell cDNA library

 PT diagnostics, forensics, gene mapping, identification of mutations
 PT responsible for genetic disorders or other traits and to assess
 PT biodiversity.
 PS
 XX Claim 1; SEQ ID NO 22978; 103pp; English.
 XX
 CC The invention relates to isolated polynucleotide (I) and polypeptide (II)
 CC sequences. (I) is useful as hybridisation probes, polymerase chain
 CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
 CC and in recombinant production of (II). The polynucleotides are also used
 CC in diagnostics as expressed sequence tags for identifying expressed
 CC genes. (I) is useful in gene therapy techniques to restore normal
 CC activity of (II) or to treat disease states involving (II). (II) is
 CC useful for generating antibodies against it, detecting or quantitating a
 CC polypeptide in tissue, as molecular weight markers and as a food
 CC supplement. (II) and its binding partners are useful in medical imaging
 CC of sites expressing (II). (I) and (II) are useful for treating disorders
 CC involving aberrant protein expression or biological activity. The
 CC polypeptide and polynucleotide sequences have application in
 CC diagnostics, forensics, gene mapping, identification of mutations
 CC responsible for genetic disorders or other traits to assess biodiversity
 CC and to produce other types of data and products dependent on DNA and
 CC amino acid sequences. AAS64197-AAS94584 represent novel human diagnostic
 CC coding sequences of the invention. Note: The sequence data for this
 CC patent did not appear in the printed specification, but was obtained in
 CC electronic format directly from WIPO at
 CC ftp.wipo.int/pub/published_pct_sequences

 XX A method, useful for prognosing and treating solid tumor, comprises
 PT comparing an expression profile of a gene expressed in peripheral blood
 PT mononuclear cells to a reference expression profile of a gene.
 XX
 PS Disclosure; Page; 11pp; English.
 XX
 CC The invention describes a method comprising comparing an expression
 CC profile of at least one gene in a peripheral blood sample of a patient to
 CC at least one reference expression profile of the at least one gene, where
 CC the patient has a solid tumour, and each of the gene is differentially
 CC expressed in peripheral blood mononuclear cells (PBMCs) of a first class
 CC of patients as compared to PBMCs of a second class of patients, where
 CC each of the first and second classes is a subcluster formed by an
 CC unsupervised clustering analysis of gene expression profiles in PBMCs of
 CC a population of patients who have the solid tumour, and where the
 CC majority of the first class of patients has a first clinical outcome, and
 CC the majority of the second class of patients has a second clinical
 CC outcome. Also described are: a system comprising (i) a memory or a
 CC storage medium including data that represent an expression profile of at
 CC least one gene in a peripheral blood sample of a patient who has a solid
 CC tumour, (ii) at least another storage medium including data that
 CC represent at least one reference expression profile of the gene, (iii) a
 CC program capable of comparing the expression profile to the reference
 CC expression profile, and (iv) a processor capable of executing the
 CC program, where expression levels of the gene in peripheral blood
 CC mononuclear cells of patients who have the solid tumour correlate with
 CC clinical outcomes of the patients; and a nucleic acid or protein array
 CC comprising concentrated probes for solid tumour prognosis genes, where
 CC each of the solid tumour prognosis genes is differentially expressed in
 CC PBMCs of a first class of patients as compared to PBMCs of a second class
 CC of patients, where both the first and second classes of patients have a
 CC solid tumour, and where the first class of patients has a first clinical
 CC outcome, and the second class of patients has a second clinical outcome.
 CC The method, system, and array are useful for prognosing and treating
 CC solid tumours. This sequence represents a solid tumour prognosis gene of
 CC the invention. Note: The sequence data for this patent did not form part
 CC of the printed specification, but was obtained in electronic format
 CC directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

 PT Detecting a breast cancer-associated transcript in a patient's cell,
 PT useful for diagnosing breast cancer, comprises contacting a biological
 PT sample with a polynucleotide that selectively hybridizes with breast
 PT cancer nucleic acids.
 XX
 PS Claim 9; Page 372; 414pp; English.
 XX
 CC The invention comprises a method of detecting a breast cancer-associated
 CC transcript in a cell from a patient. The method of the invention involves
 CC contacting a biological sample from the patient with a nucleotide that
 CC hybridises to one of the 69 breast cancer-associated gene sequences shown
 CC in the specification. The method of the invention is useful in the
 CC diagnosis or prognosis of breast cancer, and for detecting genes that are
 CC up or down-regulated in breast cancer cells. Genes identified by the
 CC method of the invention can be used in diagnostic purposes and also as
 CC targets for screening for therapeutic compounds that modulate breast
 CC cancer (e.g. hormones or antibodies). Identification of genes that are
 CC over or under expressed in breast cancer can additionally provide high-
 CC resolution, high-sensitivity datasets which can be used in the areas of
 CC diagnostics, therapeutics, drug development, pharmacogenetics, protein
 CC structure and biosensor development. DNA sequences AB07693 - AB07761
 CC represent the 69 breast cancer-associated gene sequences of the invention

XX Detecting a lung cancer-associated transcript in a cell from a patient

XX for treating lung cancer, by contacting a biological sample from the

XX patient with a polynucleotide that exhibits increased or decreased

XX expression in lung cancer.

XX Claim 22; Page 336; 453pp; English.

XX The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridizes
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences

CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

XX Detecting an ovarian cancer-associated transcript in a cell from a

XX patient, comprises contacting a biological sample from the patient with a

XX polynucleotide that hybridizes to an ovarian cancer gene.

XX Claim 10; Page 297; 332pp; English.

XX The invention relates to a method of detecting an ovarian cancer-
 CC associated transcript in a cell from a patient, by contacting a
 CC biological sample from the patient with a polynucleotide that selectively
 CC hybridizes to a sequence at least 80% identical to any of one of 80
 CC nucleic acid sequences given in the specification. The method is useful
 CC in diagnosing ovarian cancer and in identifying and using agents and/or
 CC targets that inhibit ovarian cancer. The nucleic acid molecule,
 CC polypeptide and the antibody may also be used in detecting ovarian
 CC cancers, monitoring and early detection of relapse following treatment,

CC monitoring response to therapy, selecting patients for post-operative
CC chemotherapy or radiation therapy, in selecting mode of therapy,
CC determining tumour prognosis, early detection of pre-cancerous lesions,
CC and as vaccines. This sequence corresponds to one of the nucleic acids
CC used for the detection method of the invention.

XX Determining the presence or absence of a pathological cell in a patient,
PT useful for diagnosing, prognosing or treating cancer, comprises detecting
PT a nucleic acid in a biological sample.

XX PS Claim 8; SEQ ID NO 41; 1385pp; English.

XX The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
CC whose expression is upregulated or downregulated in specific cancers or
CC other diseases such as angiogenic or fibrotic disorders, and to methods
CC of determining the presence or absence of a pathological cell in a
CC patient by detecting a nucleic acid at least 80% identical to those of
CC the invention or by detecting a polypeptide of the invention. The
CC invention also relates to expression vectors and host cells comprising a
CC nucleic acid of the invention; antibodies which specifically bind a
CC polypeptide of the invention; use of such antibodies for drug targeting;
CC and methods of screening for modulators of activity or expression of the
CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
CC antibodies and methods are useful for diagnosing, prognosing and treating
CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
CC neovascularisation syndromes, scarring and uterine fibroids. They may
CC also be useful in wound healing and in contraception. The present
CC sequence represents a nucleic acid sequence of the invention.

New NOVX polypeptides and polynucleotides, useful for preventing,
 diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer,
 Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic
 disorders, and asthma.

Claim 16; Page 114-115; 619pp; English.

CC The present invention relates to new isolated proteins (NOVX) and their
 CC coding sequences (ABV9327-ABV99595 and ABP70049-ABP70149), where X is
 CC any number from 1 to 48. The NOVX proteins and coding sequences are
 CC useful in the manufacture of a medicament for treating a syndrome
 CC associated with a human disease, preferably a NOVX-associated disorder.
 CC The NOVX coding sequences and proteins are useful for treating,
 CC preventing or diagnosing diseases such as metabolic disorders, diabetes,
 CC obesity, infectious disease, anorexia, cancer-associated cachexia,
 CC cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's
 CC disease, immune disorders, haematopoietic disorders, cardiovascular
 CC disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic
 CC disturbances associated with obesity, metabolic syndrome X or wasting
 CC disorders associated with chronic diseases or various cancers. The NOVX
 CC coding sequences and proteins may also be used as targets for the
 CC identification of small molecules that modulate or inhibit e.g.
 CC neurogenesis, cell differentiation, cell proliferation, haematopoiesis,
 CC wound healing and angiogenesis, in gene therapy, in generation of
 CC antibodies that bind immunospecifically to NOVX substances for use in
 CC therapeutic or diagnostic methods

 CC Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
 PT response useful in vaccinating against and in treating tumors.
 XX
 PS Example 2; Page 78; 79pp; English.
 XX

CC The present sequence encodes the human 5T4 tumour-associated antigen
 CC (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
 CC carcinomas but has a highly restricted expression pattern in normal adult
 CC tissues. It appears to be strongly correlated to metastasis in colorectal
 CC and gastric cancer. 5T4 antigen may therefore be useful in tumour
 CC diagnosis, targeting and immunotherapy. Mice in which tumours had been
 CC induced were inoculated with a virus expression vector containing the
 CC present sequence. The 5T4 antigen was shown to be effective at eliciting
 CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding
 CC the antigen and the antigen itself can be used to elicit an immune
 CC response, preferably CTL or an antibody response in a subject

 PT Identifying a candidate p53 pathway-modulating agent for treating cancer
 PT comprises contacting an assay system comprising a purified leucine rich
 PT repeat, capricious related polypeptide or nucleic acid with a test agent.
 XX
 PS Disclosure; Page 75-76; 99pp; English.
 XX
 CC The invention relates to a method of identifying a candidate p53 pathway
 CC modulating agent. The method involves contacting an assay system
 CC comprising a purified Leucine rich repeat, capricious related (LRRCAPS)
 CC polypeptide or nucleic acid or its fragment with a test agent and
 CC detecting a test agent-biased activity, where a difference between the
 CC test agent-biased activity and the reference activity identifies the test
 CC agent as a candidate p53 pathway modulating agent. The method is useful

CC for identifying a candidate p53 pathway-modulating agent for preparing a
CC composition for diagnosing or treating cancer. The invention is useful in
CC gene therapy. The present sequence is human LRRCAPS related DNA

XX New genes regulated by MYCN activation, useful in gene therapy,
PT particularly for treating a subject with e.g. neuroblastoma or other
PT cancers, or for diagnosing, staging or monitoring the treatment of the
PT cancer.

XX Claim 1; SEQ ID NO 105; 27pp; English.

XX This invention relates to novel isolated cDNAs that are differentially
CC expressed in MYCN activated cells. Specifically, it refers to
CC polynucleotide sequences that exhibit differential expression patterns in
CC cells activated by the transactivator MYCN, where MYCN is a proto-
CC oncogene that is amplified in neuroblastoma cells and is common in small
CC cell lung cancers. The present invention describes these cDNA molecules
CC as useful for in hybridisation assays to detect expression of nucleic
CC acids (or complementary nucleic acids) in a present in a given sample, as
CC well as for screening assays by identifying molecules or compounds that
CC specifically bind the cDNA as a ligand and modulate function or activity.
CC Accordingly, these compositions exhibit cytostatic activity and can also
CC be used for gene therapy purposes. This polynucleotide sequence is a cDNA
CC that is differentially expressed in MYCN activated cells, given in an

CC exemplification of the invention. NOTE: This sequence does not appear in
CC the printed specification but has been obtained in electronic format from
CC the US Patent Office at
CC ftp.seqdata.uspto.gov/sequence.html?DocID=20030119009.

XX Detecting a bladder cancer-associated transcript in a cell from a
PT patient, comprises contacting a biological sample from the patient with a
PT bladder cancer-associated polynucleotide or antibody.

XX Claim 6; Page 296; 307pp; English.

XX The present invention describes a method for detecting a bladder cancer-
CC associated transcript in a cell from a patient. The method comprises
CC contacting a biological sample from the patient with a polynucleotide
CC that selectively hybridises to a sequence that is 80 % identical to a
CC table of sequences (see ACC50951 to ACC51059). ACC50951 to ACC51059
CC encode the human bladder cancer-associated proteins given in ABR48146 to
CC ABR48242). Bladder cancer-associated sequences from the present invention
CC have cytostatic activities, and can be used in antisense gene therapy and
CC in vaccine production. The method can be used for detecting a bladder
CC cancer-associated transcript in a cell from a patient. The method is
CC useful in diagnosing or treating bladder cancer and in screening for
CC compounds that modulate bladder cancer, such as hormones or antibodies.
CC The nucleic acid molecules from the present invention may be used in

CC various screening and diagnostic methods, and for gene therapy, vaccine
 CC and/or antisense/inhibition applications

XX

XX Detecting a lung cancer-associated transcript in a cell from a patient

XX for treating lung cancer, by contacting a biological sample from the

XX patient with a polynucleotide that exhibits increased or decreased

XX expression in lung cancer.

XX

XX Claim 22; Page 335; 453pp; English.

XX

XX The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridises
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by

CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

(E-mail: flj-cdn@nifty.com, Tel: 81-438-52-3975, Fax: 81-438-52-3986)

COMMENT
NEDO human cDNA sequencing project supported by Ministry of
Economy, Trade and Industry of Japan; cDNA full insert sequencing:
Research Association for Biotechnology; cDNA library construction:
Institute of Medical Science, University of Tokyo, Laboratory of
Genome Structure, Human Genome Center; cDNA 5'- & 3'-end one pass
sequencing and clone selection: Helix Research Institute (supported
by Japan Key Technology Center etc.).

PT low stringency for preparing single-stranded cDNA from mRNA of
PT individual.
XX
XX Example 9; Page 302; 959pp; English.
PS
PR
XX

CC The invention describes a method of determining open reading frames in
CC the genome of organism, comprising contacting mRNA from cell of organism
CC with a single oligonucleotide primer (I) at low stringency, preparing
CC single-stranded cDNA by reverse transcribing mRNA with (I), amplifying
CC cDNA, sequencing the product, and repeating the contacting, preparing
CC and amplifying steps with different primers and sequencing resulting
CC nucleic acids. The method is useful for: determining that a known
CC nucleotide sequence from a genome of an organism corresponds to a
CC nucleotide sequence of an open reading frame; for preparing a contig,
CC nucleic acid molecule from a genome of an organism; and for sequencing
CC all or part of a genome of an organism. mRNA is obtained from mammalian
CC or human cell which is associated with a pathological condition e.g. a
CC colon cancer or breast cancer cell. The method is useful for analyses of
CC populations of subjects and can be used to carry out genetic analyses of
CC large or small populations. further, it can be used to study living
CC systems to determine if, e.g. there have been genetic shifts which render
CC an individual or population more or less likely to be afflicted with
CC diseases such as cancer, to determine antibiotic resistance or non-
CC tolerance, and so forth. The method can also be used in the study of
CC congenital diseases, and the risk of affliction to a foetus, as well as
CC the study of whether the conditions are likely to be passed to offspring
CC through ova or sperm. The analyses for pathological conditions can be
CC carried out in all animals, plants, birds, fish, etc. Using this method,
CC in the area of agriculture, for example the genomes of food crops can be
CC studied to determine if resistance genes are present, defects in plant
CC genomes can also be studied in this way. Similarly, the method permits
CC determination of the pathogens which integrate into the genome, such as
CC retroviruses and other integrating viruses such as influenza virus, have
CC undergone shifts or mutations, which may require different approaches to
CC therapy. This method is also applied to eukaryotic pathogens, such as
CC trypanosomes, different types of Plasmodium, etc. The method essentially
CC eliminates sequencing of non-coding portions. This sequence represents a
XX polynucleotide isolated from human colon cancer cell cDNA library

XX New isolated polynucleotide and encoded polypeptides, useful in
PT diagnostics, forensics, gene mapping, identification of mutations
PT responsible for genetic disorders or other traits and to assess
PT biodiversity.
XX
XX Claim 1; SEQ ID NO 22978; 103pp; English.
XX
XX The invention relates to isolated polynucleotide (I) and polypeptide (II)
CC sequences. (I) is useful as hybridisation probes, polymerase chain
CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
CC and in recombinant production of (II). The polynucleotides are also used
CC in diagnostics as expressed sequence tags for identifying expressed
CC genes. (I) is useful in gene therapy techniques to restore normal
CC activity of (II) or to treat disease states involving (II). (II) is
CC useful for generating antibodies against it, detecting or quantitating a
CC polypeptide in tissue, as molecular weight markers and as a food
CC supplement. (II) and its binding partners are useful in medical imaging
CC of sites expressing (II). (I) and (II) are useful for treating disorders
CC involving aberrant protein expression or biological activity. The
CC polypeptide and polynucleotide sequences have applications in
CC diagnostics, forensics, gene mapping, identification of mutations
CC responsible for genetic disorders or other traits to assess biodiversity
CC and to produce other types of data and products dependent on DNA and
CC amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic
CC coding sequences of the invention. Note: The sequence data for this
CC patent did not appear in the printed specification, but was obtained in

PT A method, useful for prognosing and treating solid tumor, comprises
PT comparing an expression profile of a gene expressed in peripheral blood
PT mononuclear cells to a reference expression profile of a gene.
XX
PS Disclosure; Page; 11pp; English.
XX
XX The invention describes a method comprising comparing an expression
CC profile of at least one gene in a peripheral blood sample of a patient to
CC at least one reference expression profile of the at least one gene, where
CC the patient has a solid tumour, and each of the gene is differentially
CC expressed in peripheral blood mononuclear cells (PBMCs) of a first class
CC of patients as compared to PBMCs of a second class of patients, where
CC both the first and second classes of patients have the solid tumour, and
CC each of the first and second classes is a subcluster formed by an
CC unsupervised clustering analysis of gene expression profiles in PBMCs of
CC a population of patients who have the solid tumour, and where the
CC majority of the first class of patients has a first clinical outcome, and
CC the majority of the second class of patients has a second clinical
CC outcome. Also described are: a system comprising (i) a memory or a
CC storage medium including data that represent an expression profile of at
CC least one gene in a peripheral blood sample of a patient who has a solid
CC tumour, (ii) at least another storage medium including data that
CC represent at least one reference expression profile of the gene, (iii) a
CC program capable of comparing the expression profile to the reference
CC expression profile, and (iv) a processor capable of executing the
CC program, where expression levels of the gene in peripheral blood
CC mononuclear cells of patients who have the solid tumour correlate with
CC clinical outcomes of the patients; and a nucleic acid or protein array
CC comprising concentrated probes for solid tumour prognosis genes, where
CC each of the solid tumour prognosis genes is differentially expressed in
CC PBMCs of a first class of patients as compared to PBMCs of a second class
CC of patients, where both the first and second classes of patients have a
CC solid tumour, and where the first class of patients has a first clinical
CC outcome, and the second class of patients has a second clinical outcome.
CC The method, system, and array are useful for prognosing and treating
CC solid tumours. This sequence represents a solid tumour prognosis gene of
CC the invention. Note: The sequence data for this patent did not form part
CC of the printed specification, but was obtained in electronic format
CC directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

XX Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
XX response useful in vaccinating against and in treating tumors.
XX
XX Disclosure; Page 78-79; 79pp; English.
XX
XX The present sequence encodes the canine 5T4 tumour-associated antigen
XX (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in
XX carcinomas but has a highly restricted expression pattern in normal adult
XX tissues. It appears to be strongly correlated to metastasis in colorectal
XX and gastric cancer. 5T4 antigen may therefore be useful in tumour
XX diagnosis, targeting and immunotherapy. Mice in which tumours had been
XX induced were inoculated with a virus expression vector containing the
XX human or murine 5T4 gene sequence. The 5T4 antigen was shown to be
XX effective at eliciting an immunotherapeutic anti-tumour response. Both
XX the nucleic acid encoding the antigen and the antigen itself can be used
XX to elicit an immune response, preferably CTL or an antibody response in a
XX subject

 PT Detecting a breast cancer-associated transcript in a patient's cell,
 PT useful for diagnosing breast cancer, comprises contacting a biological
 PT sample with a polynucleotide that selectively hybridizes with breast
 PT cancer nucleic acids.
 XX
 PS Claim 9; Page 372; 414pp; English.
 XX
 CC The invention comprises a method of detecting a breast cancer-associated
 CC transcript in a cell from a patient. The method of the invention involves
 CC contacting a biological sample from the patient with a nucleotide that
 CC hybridizes to one of the 69 breast cancer-associated gene sequences shown
 CC in the specification. The method of the invention is useful in the
 CC diagnosis or prognosis of breast cancer, and for detecting genes that are
 CC up or down-regulated in breast cancer cells. Genes identified by the
 CC method of the invention can be used in diagnostic purposes and also as
 CC targets for screening for therapeutic compounds that modulate breast
 CC cancer (e.g. hormones or antibodies). Identification of genes that are
 CC over or under expressed in breast cancer can additionally provide high-
 CC resolution, high-sensitivity datasets which can be used in the areas of
 CC diagnostics, therapeutics, drug development, pharmacogenetics, protein
 CC structure and biosensor development. DNA sequences ABT07693 - ABT07761
 CC represent the 69 breast cancer-associated gene sequences of the invention

 PT Detecting a lung cancer-associated transcript in a cell from a patient
 PT for treating lung cancer, by contacting a biological sample from the
 PT patient with a polynucleotide that exhibits increased or decreased
 PT expression in lung cancer.
 XX
 PS Claim 22; Page 336; 453pp; English.
 XX
 CC The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridises
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

 XX Detecting an ovarian cancer-associated transcript in a cell from a
 PT patient, comprises contacting a biological sample from the patient with a
 PT polynucleotide that hybridizes to an ovarian cancer gene.
 XX Claim 10; Page 297; 332pp; English.
 XX The invention relates to a method of detecting an ovarian cancer-
 CC associated transcript in a cell from a patient, by contacting a
 CC biological sample from the patient with a polynucleotide that selectively
 CC hybridizes to a sequence at least 80% identical to any of one of 80
 CC nucleic acid sequences given in the specification. The method is useful
 CC in diagnosing ovarian cancer and in identifying and using agents and/or
 CC targets that inhibit ovarian cancer. The nucleic acid molecule,
 CC polypeptide and the antibody may also be used in detecting ovarian
 CC cancers, monitoring and early detection of relapse following treatment,
 CC monitoring response to therapy, selecting patients for post-operative
 CC chemotherapy or radiation therapy, in selecting mode of therapy,
 CC determining tumour prognosis, early detection of pre-cancerous lesions,
 CC and as vaccines. This sequence corresponds to one of the nucleic acids
 CC used for the detection method of the invention.

 XX Determining the presence or absence of a pathological cell in a patient,
 PT useful for diagnosing, prognosing or treating cancer, comprises detecting
 PT a nucleic acid in a biological sample.
 XX Claim 8; SEQ ID NO 41; 1385pp; English.
 XX The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
 CC whose expression is upregulated or downregulated in specific cancers or
 CC other diseases such as angiogenic or fibrotic disorders, and to methods
 CC of determining the presence or absence of a pathological cell in a
 CC patient by detecting a nucleic acid at least 80% identical to those of
 CC the invention or by detecting a polypeptide of the invention. The
 CC invention also relates to expression vectors and host cells comprising a
 CC nucleic acid of the invention; antibodies which specifically bind a
 CC polypeptide of the invention; use of such antibodies for drug targeting;
 CC and methods of screening for modulators of activity or expression of the
 CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
 CC antibodies and methods are useful for diagnosing, prognosing and treating
 CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
 CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
 CC neovascularisation syndromes, scarring and uterine fibroids. They may
 CC also be useful in wound healing and in contraception. The present
 CC sequence represents a nucleic acid sequence of the invention.

PT Identifying a candidate p53 pathway-modulating agent for treating cancer
PT comprises contacting an assay system comprising a purified leucine rich
PT repeat, capricious related polypeptide or nucleic acid with a test agent.
XX
PS Example 5; Page 74-75; 99pp; English.
XX
CC The invention relates to a method of identifying a candidate p53 pathway
CC modulating agent. The method involves contacting an assay system
CC comprising a purified leucine rich repeat, capricious related (LRRCAPS)
CC polypeptide or nucleic acid or its fragment with a test agent and
CC detecting a test agent-biased activity, where a difference between the
CC test agent-biased activity and the reference activity identifies the test
CC agent as a candidate p53 pathway modulating agent. The method is useful
CC for identifying a candidate p53 pathway-modulating agent for preparing a
CC composition for diagnosing or treating cancer. The invention is useful in
CC gene therapy. The present sequence is human LRRCAPS related DNA

XX New NOVX polypeptides and polynucleotides, useful for preventing,
PT diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer,
PT Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic
PT disorders, and asthma.
XX
XX Claim 16; Page 114-115; 619pp; English.
XX
XX The present invention relates to new isolated proteins (NOVX) and their
CC coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is
CC any number from 1 to 48. The NOVX proteins and coding sequences are
CC useful in the manufacture of a medicament for treating a syndrome
CC associated with a human disease, preferably a NOVX-associated disorder.
CC The NOVX coding sequences and proteins are useful for treating,
CC preventing or diagnosing diseases such as metabolic disorders, diabetes,
CC obesity, infectious disease, anorexia, cancer-associated cachexia,
CC cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's
CC disease, immune disorders, haematopoietic disorders, cardiovascular
CC disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic
CC disturbances associated with obesity, metabolic syndrome X or wasting
CC disorders associated with chronic diseases or various cancers. The NOVX
CC coding sequences and proteins may also be used as targets for the
CC identification of small molecules that modulate or inhibit e.g.
CC neurogenesis, cell differentiation, cell proliferation, haematopoiesis,
CC wound healing and angiogenesis, in gene therapy, in generation of
CC antibodies that bind immunospecifically to NOVX substances for use in
CC therapeutic or diagnostic methods

XX
XX Novel canine or feline 5T4 polypeptide and polynucleotides encoding the
PT polypeptide, useful in preparation of vaccine for treating and/or
PT preventing cancer in a subject, preferably a dog or cat.
XX
XX Claim 4; Page 68; 68pp; English.
XX
XX The present invention relates to the isolation of canine and feline
CC oncofoetal leucine-rich glycoproteins known as 5T4, and the
CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in
CC a significant proportion of tumours. The sequences of the invention are
CC useful in a pharmaceutical composition for the prevention and/or
CC treatment of tumours or other diseases associated with cell
CC proliferation, infections, and inflammatory conditions in animals,
CC preferably dogs or cats. The compositions may also be used for cancer
CC immunotherapy in these animals. The sequences of the invention may also
CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
CC measurement and localisation of 5T4 in extracts of plasma, urine,
CC tissues, and in cell culture media. Antibodies specific for the 5T4
CC protein are useful for isolating foetal cells from maternal blood. The
CC isolation process may form part of a diagnostic method e.g. the foetal
CC cells may then be subject to biochemical or genetic sampling used for
CC testing foetal abnormalities, or to determine the sex of the foetus(es).
CC The present sequence encodes feline 5T4 protein

 XX
 XX New major histocompatibility complex class I peptide epitopes from human
 PT 574 tumor-associated antigen, useful for preventing and/or treating a
 PT disease, particularly cancer.
 XX
 XX Disclosure; Page 67; 73pp; English.
 XX
 XX The invention relates to a novel Major Histocompatibility Complex (MHC)
 CC class I peptide epitope of the 574 antigen. The invention further
 CC provides a polypeptide string comprising the 574 epitope; a nucleic acid
 CC sequence encoding the 574 epitope or a polypeptide string of the 574
 CC epitope; a vector system capable of delivering the 574 epitope nucleic
 CC acid to a cell; a cell pulsed with the 574 epitope, a polypeptide of the
 CC 574 epitope, its encoding nucleic acid, or the vector system; a vaccine
 CC comprising the above; a method for treating and/or preventing a disease
 CC in a subject by administering the vaccine; an agent capable of binding
 CC specifically to the 574 epitope and/its encoding nucleic acid; a method
 CC comprising detecting the presence of the 574 epitope or its encoding
 CC nucleic acid in a subject; and a T cell line or clone capable of
 CC specifically recognising the 574 epitope in conjunction with an MHC class
 CC I molecule. The 574 epitope has cytostatic activity. The vaccine
 CC comprising the 574 epitope or its encoding nucleic acid and the vector
 CC system or cell is useful in the prevention and/or treatment of a disease,
 CC monitoring the progression of a cancerous disease, and for detecting the
 CC presence of the 574 epitope or its nucleic acid. The T cell line or clone
 CC is useful in the manufacture of a medicament for treating and/or
 CC preventing a disease. This polynucleotide sequence represents the feline
 CC 574 antigen coding DNA of the invention.

 XX
 XX New Major Histocompatibility Complex class II peptide epitope of 574,
 PT useful for manufacturing a medicament for diagnosing, preventing and/or
 PT treating a disease, e.g. cancer.
 XX
 XX Disclosure; Page 49; 63pp; English.
 XX
 XX The invention relates to a Major Histocompatibility Complex (MHC) class
 CC II peptide epitope of the 574 antigen. The vaccine or T-cell line or
 CC clone has a cytostatic activity, as it is useful in manufacturing a
 CC medicament for preventing and/or treating a disease, particularly cancer.
 CC The methods are useful for detecting T-cells capable of specifically
 CC recognising a peptide epitope in conjunction with an MHC molecule, for
 CC diagnosing or monitoring the progression of a cancerous disease, or for
 CC detecting the presence of a peptide or nucleic acid using an agent. The
 CC MHC class II peptide epitope of the invention can be used in gene therapy
 CC or as part of a vaccine. This polynucleotide sequence represents the DNA
 CC coding for the feline 574 protein.

 XX Inhibiting a cancerous phenotype of a cell, useful for treating breast
 PT cancer comprises contacting a cancerous mammalian cell with an agent for
 PT inhibition of DRFZp5661133 activity.
 XX Claim 30; SEQ ID NO 47; 257pp; English.
 PS The invention relates to a method of inhibiting a cancerous phenotype of
 CC a cell comprises contacting a cancerous mammalian cell with an agent for
 CC inhibition of DRFZp5661133 activity. The methods are useful for treating
 CC cancer, e.g. breast cancer. This sequence represents a gene product which
 CC is differentially expressed in breast cancer cells. The sequence can be
 CC used in the method of the invention.

 PT A method, useful for prognosing and treating solid tumor, comprises
 PT comparing an expression profile of a gene expressed in peripheral blood
 PT mononuclear cells to a reference expression profile of a gene.
 XX
 PS Disclosure; Page; 111pp; English.
 XX
 CC The invention describes a method comprising comparing an expression
 CC profile of at least one gene in a peripheral blood sample of a patient to
 CC at least one reference expression profile of the at least one gene, where
 CC the patient has a solid tumour, and each of the gene is differentially

CC expressed in peripheral blood mononuclear cells (PBMCs) of a first class
 CC of patients as compared to PBMCs of a second class of patients, where
 CC both the first and second classes of patients have the solid tumour, and
 CC each of the first and second classes is a subcluster formed by an
 CC unsupervised clustering analysis of gene expression profiles in PBMCs of
 CC a population of patients who have the solid tumour, and where the
 CC majority of the first class of patients has a first clinical outcome, and
 CC the majority of the second class of patients has a second clinical
 CC outcome. Also described are: a system comprising (i) a memory or a
 CC storage medium including data that represent an expression profile of at
 CC tumour, (ii) at least another storage medium including data that
 CC represent at least one reference expression profile of the gene, (iii) a
 CC program capable of comparing the expression profile to the reference
 CC expression profile, and (iv) a processor capable of executing the
 CC program, where expression levels of the gene in peripheral blood
 CC mononuclear cells of patients who have the solid tumour correlate with
 CC clinical outcomes of the patients; and a nucleic acid or protein array
 CC comprising concentrated probes for solid tumour prognosis genes, where
 CC each of the solid tumour prognosis genes is differentially expressed in
 CC PBMCs of a first class of patients as compared to PBMCs of a second class
 CC of patients, where both the first and second classes of patients have a
 CC solid tumour, and where the first class of patients has a first clinical
 CC outcome, and the second class of patients has a second clinical outcome.
 CC The method, system, and array are useful for prognosing and treating
 CC solid tumours. Note: The sequence represents a solid tumour prognosis gene of
 CC the invention. Note: The sequence data for this patent did not form part
 CC of the printed specification, but was obtained in electronic format
 CC directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

 Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte
 response useful in vaccinating against and in treating tumors.
 Disclosure; Page 78-79; 79pp; English.
 The present sequence encodes the canine 5T4 tumour-associated antigen
 (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in

CC carcinomas but has a highly restricted expression pattern in normal adult
 tissues. It appears to be strongly correlated to metastasis in colorectal
 and gastric cancer. 5T4 antigen may therefore be useful in tumour
 diagnosis, targeting and immunotherapy. Mice in which tumours had been
 induced were inoculated with a virus expression vector containing the
 human or murine 5T4 gene sequence. The 5T4 antigen was shown to be
 effective at eliciting an immunotherapeutic anti-tumour response. Both
 the nucleic acid encoding the antigen and the antigen itself can be used
 to elicit an immune response, preferably CTL or an antibody response in a
 subject

 XX Detecting a breast cancer-associated transcript in a patient's cell,
 PT useful for diagnosing breast cancer, comprises contacting a biological
 PT sample with a polynucleotide that selectively hybridizes with breast
 PT cancer nucleic acids.
 XX Claim 9; Page 372; 414pp; English.
 XX The invention comprises a method of detecting a breast cancer-associated
 CC transcript in a cell from a patient. The method of the invention involves
 CC contacting a biological sample from the patient with a nucleotide that
 CC hybridises to one of the 69 breast cancer-associated gene sequences shown

CC in the specification. The method of the invention is useful in the
 CC diagnosis or prognosis of breast cancer, and for detecting genes that are
 CC up or down-regulated in breast cancer cells. Genes identified by the
 CC method of the invention can be used in diagnostic purposes and also as
 CC targets for screening for therapeutic compounds that modulate breast
 CC cancer (e.g. hormones or antibodies). Identification of genes that are
 CC over or under expressed in breast cancer can additionally provide high-
 CC resolution, high-sensitivity datasets which can be used in the areas of
 CC diagnostics, therapeutics, drug development, pharmacogenetics, protein
 CC structure and biosensor development. DNA sequences ABT07693 - ABT07761
 CC represent the 69 breast cancer-associated gene sequences of the invention

XX XX

XX PS Claim 22; Page 336; 453pp; English.

XX XX

CC The invention relates to a method for detecting a lung cancer-associated
 CC transcript in a cell from a patient, comprising contacting a biological
 CC sample from the patient with a polynucleotide that selectively hybridises
 CC to a sequence that is at least 80 % identical to a gene that exhibits
 CC increased or decreased expression in lung cancer samples. Lung cancer-
 CC associated polynucleotides and polypeptides are used for identifying a
 CC compound that modulates a lung cancer-associated polypeptide, for
 CC inhibiting proliferation of a lung cancer-associated cell to treat lung
 CC cancer in a patient and for treating a mammal having lung cancer by
 CC administering a modulatory compound identified. The methods are useful
 CC for treating lung cancer, such as small cell lung cancer, non-small cell
 CC lung cancer or other benign or precancerous lesions, e.g. atelectasis,
 CC emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis,
 CC hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and
 CC bronchiectasis. The genes, polynucleotides and polypeptides are useful
 CC for diagnostic purposes and as targets for screening for therapeutic
 CC compounds that modulate lung cancer, such as antibodies. Sequences
 CC ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the
 CC invention

 XX Detecting an ovarian cancer-associated transcript in a cell from a
 PT patient, comprises hybridizing a biological sample from the patient with a
 PT polynucleotide that hybridizes to an ovarian cancer gene.
 XX
 PS Claim 10; Page 297; 332pp; English.
 XX
 CC The invention relates to a method of detecting an ovarian cancer-
 CC associated transcript in a cell from a patient, by contacting a
 CC biological sample from the patient with a polynucleotide that selectively
 CC hybridizes to a sequence at least 80% identical to any of one of 80
 CC nucleic acid sequences given in the specification. The method is useful
 CC in diagnosing ovarian cancer and in identifying and using agents and/or
 CC targets that inhibit ovarian cancer. The nucleic acid molecule,
 CC polypeptide and the antibody may also be used in detecting ovarian
 CC cancers, monitoring and early detection of relapse following treatment,
 CC monitoring response to therapy, selecting patients for post-operative
 CC chemotherapy or radiation therapy, in selecting mode of therapy,
 CC determining tumour prognosis, early detection of pre-cancerous lesions,
 CC and as vaccines. This sequence corresponds to one of the nucleic acids
 CC used for the detection method of the invention.

 PT Determining the presence or absence of a pathological cell in a patient,
 PT useful for diagnosing, prognosing or treating cancer, comprises detecting
 PT a nucleic acid in a biological sample.
 XX
 XX Claim 8; SEQ ID NO 41; 1385pp; English.
 XX
 CC The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
 CC whose expression is upregulated or downregulated in specific cancers or
 CC other diseases such as angiogenic or fibrotic disorders, and to methods
 CC of determining the presence or absence of a pathological cell in a
 CC patient by detecting a nucleic acid at least 80% identical to those of
 CC the invention or by detecting a polypeptide of the invention. The
 CC invention also relates to expression vectors and host cells comprising a
 CC nucleic acid of the invention; antibodies which specifically bind a
 CC polypeptide of the invention; use of such antibodies for drug targeting;
 CC and methods of screening for modulators of activity or expression of the
 CC polypeptides and nucleic acids. The nucleic acids, polypeptides,
 CC antibodies and methods are useful for diagnosing, prognosing and treating
 CC cancer and other conditions such as psoriasis, ischaemia, heart disease,
 CC atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
 CC neovascularisation syndromes, scarring and uterine fibroids. They may
 CC also be useful in wound healing and in contraception. The present
 CC sequence represents a nucleic acid sequence of the invention.

 XX
 XX The present invention relates to the isolation of canine and feline
 CC oncofoetal leucine-rich glycoproteins known as 5T4, and the
 CC polynucleotide sequences encoding them. The 5T4 proteins are expressed in
 CC a significant proportion of tumours. The sequences of the invention are
 CC useful in a pharmaceutical composition for the prevention and/or
 CC treatment of tumours or other diseases associated with cell
 CC proliferation, infections, and inflammatory conditions in animals,
 CC preferably dogs or cats. The compositions may also be used for cancer
 CC immunotherapy in these animals. The sequences of the invention may also
 CC be used in diagnostic kits for rapid, reliable, sensitive, and specific
 CC measurement and localisation of 5T4 in extracts of plasma, urine,
 CC tissues, and in cell culture media. Antibodies specific for the 5T4
 CC protein are useful for isolating foetal cells from maternal blood. The
 CC isolation process may form part of a diagnostic method e.g. the foetal
 CC cells may then be subject to biochemical or genetic sampling used for
 CC testing foetal abnormalities, or to determine the sex of the foetus(es).

 CC The invention relates to a novel Major Histocompatibility Complex (MHC)
 CC class I peptide epitope of the 5T4 antigen. The invention further
 CC provides a polypeptide string comprising the 5T4 epitope; a nucleic acid
 CC sequence encoding the 5T4 epitope or a polypeptide string of the 5T4
 CC epitope; a vector system capable of delivering the 5T4 epitope nucleic
 CC acid to a cell; a cell pulsed with the 5T4 epitope, a polypeptide of the
 CC 5T4 epitope, its encoding nucleic acid, or the vector system; a vaccine
 CC comprising the above; a method for treating and/or preventing a disease
 CC in a subject by administering the vaccine; an agent capable of binding
 CC specifically to the 5T4 epitope and/its encoding nucleic acid; a method
 CC comprising detecting the presence of the 5T4 epitope or its encoding
 CC nucleic acid in a subject; and a T cell line or clone capable of
 CC specifically recognising the 5T4 epitope in conjunction with an MHC class
 CC I molecule. The 5T4 epitope has cytostatic activity. The vaccine
 CC comprising the 5T4 epitope or its encoding nucleic acid and the vector
 CC system or cell is useful in the prevention and/or treatment of a disease,
 CC particularly cancer. The detection method is useful for diagnosing or
 CC monitoring the progression of a cancerous disease, and for detecting the
 CC presence of the 5T4 epitope or its nucleic acid. The T cell line or clone
 CC is useful in the manufacture of a medicament for treating and/or
 CC preventing a disease. This polynucleotide sequence represents the feline
 CC 5T4 antigen coding DNA of the invention.

XX Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.
XX Example 2; Page 78; 79pp; English.
XX The present sequence encodes the human 5T4 tumour-associated antigen (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in CC carcinomas but has a highly restricted expression pattern in normal adult CC tissues. It appears to be strongly correlated to metastasis in colorectal CC and gastric cancer. 5T4 antigen may therefore be useful in tumour CC diagnosis, targeting and immunotherapy. Mice in which tumours had been CC induced were inoculated with a virus expression vector containing the CC present sequence. The 5T4 antigen was shown to be effective at eliciting CC an immunotherapeutic anti-tumour response. Both the nucleic acid encoding CC the antigen and the antigen itself can be used to elicit an immune CC response, preferably CTL or an antibody response in a subject

XX Use of single chain antibody capable of recognizing a disease associated PT molecule for manufacturing a medicament for preventing and/or treating a PT disease condition associated with disease associated molecule.
XX Disclosure; Fig 26; 118pp; English.
XX The specification describes the use of a single chain antibody (ScFv), CC which is capable of recognizing a disease associated molecule in the CC manufacture of a medicament for the prevention and treatment of a disease CC condition. The ScFv antibody is useful in the manufacture of a CC medicament, for affecting a disease in vivo, for preparing a CC pharmaceutical composition, for in vivo imaging and/or for adjuvant CC treatment of a disease. The ScFv antibody is also useful for treating CC inflammatory diseases including arthritis, hypersensitivity, autoimmune CC diseases, cancers, central nervous system disorders including Parkinson's CC disease, periodontal diseases, cardiopulmonary diseases, cardiovascular CC diseases, gastrointestinal disorders, infections, diabetes, Helicobacter- CC related diseases, and other immune disorders. The present sequence CC encodes a 5T4 protein, which is used to produce ScFv of the invention

RESULT 15

AX467371
LOCUS AX467371 1263 bp DNA linear PAT 16-JUL-2002
DEFINITION Sequence 1 from Patent WO0238612.
ACCESSION AX467371
VERSION AX467371.1 GI:21900602

KEYWORDS
SOURCE Canis sp.
ORGANISM Canis sp.
Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Laurasiatheria; Carnivora; Fissipedia; Canidae;
Canis.

REFERENCE 1
AUTHORS Myers, K., Drury, N. and Carroll, M.

TITLE Polypeptide
JOURNAL Patent: WO 0238612-A 1 16-MAY-2002;
Oxford Biomedica (UK) Limited (GB)

FEATURES
source
1..1263
/organism="Canis sp."
/mol_type="unassigned DNA"
/db_xref="taxon:9616"
